2 Data Structure Index

2.1 Data Structures

Here are the data structures with brief descriptions:

| | |
|-----------------------------|----|
| FIFO_t | 59 |
| GPIO_Port_t | 60 |
| Led_t | 60 |
| Timer_t | 60 |
| UART_t | 61 |

3 File Index

3.1 File List

Here is a list of all documented files with brief descriptions:

| | |
|---|----|
| DAQ.c | |
| Source code for DAQ module | 61 |
| DAQ.h | |
| Application software for handling data acquisition (DAQ) functions | 63 |
| Debug.h | |
| Functions to output debugging information to a serial port via UART | 63 |
| LCD.c | |
| Source code for LCD module | 64 |
| LCD.h | |
| Module for outputting the ECG waveform and HR to a liquid crystal display (LCD) | 66 |
| QRS.c | |
| Source code for QRS module | 68 |

| | |
|--|-----|
| QRS.h | |
| QRS detection algorithm functions | 70 |
| FIFO.c | |
| Source code for FIFO buffer module | 71 |
| FIFO.h | |
| FIFO buffer data structure | 72 |
| ISR.c | |
| Source code for interrupt vector handling module | 73 |
| ISR.h | |
| Module for configuring interrupt service routines (ISRs) | 78 |
| lookup.c | |
| Source code for DAQ module's lookup table | 82 |
| lookup.h | |
| Lookup table for DAQ module | 82 |
| NewAssert.c | |
| Source code for custom <code>assert</code> implementation | 83 |
| NewAssert.h | |
| Header file for custom <code>assert</code> implementation | 83 |
| ADC.c | |
| Source code for ADC module | 84 |
| ADC.h | |
| Driver module for analog-to-digital conversion (ADC) | 84 |
| GPIO.c | |
| Source code for GPIO module | 85 |
| GPIO.h | |
| Header file for general-purpose input/output (GPIO) device driver | 94 |
| PLL.c | |
| Implementation details for phase-lock-loop (PLL) functions | 101 |
| PLL.h | |
| Driver module for activating the phase-locked-loop (PLL) | 102 |
| SPI.c | |
| Source code for SPI module | 102 |
| SPI.h | |
| Driver module for using the serial peripheral interface (SPI) protocol | 103 |
| SysTick.c | |
| Implementation details for SysTick functions | 104 |
| SysTick.h | |
| Driver module for using SysTick-based timing and/or interrupts | 105 |
| Timer.c | |
| Source code for Timer module | 105 |
| Timer.h | |
| Device driver for general-purpose timer modules | 106 |

| | |
|---|-----|
| UART.c | |
| Source code for UART module | 107 |
| UART.h | |
| Driver module for serial communication via UART0 and UART 1 | 109 |
| main.c | |
| Main program file for ECG-HRM | 109 |
| ILI9341.c | |
| Source code for ILI9341 module | 110 |
| ILI9341.h | |
| Driver module for interfacing with an ILI9341 LCD driver | 112 |
| Led.c | |
| Source code for LED module | 113 |
| Led.h | |
| Interface for LED module | 114 |
| test_adc.c | |
| Test script for analog-to-digital conversion (ADC) module | 115 |
| test_daq.c | |
| Test script for the data acquisition (DAQ) module | 116 |
| test_debug.c | |
| Test script for Debug module | 117 |
| test_fifo.c | |
| Test script for FIFO buffer | 117 |
| test_lcd_image.c | |
| Test script for writing images onto the display | 118 |
| test_lcd_scroll.c | |
| Test script for writing different colors on the LCD | 119 |
| test_pll.c | |
| Test script for the PLL module | 119 |
| test_qrs.c | |
| QRS detector test script | 120 |
| test_spi.c | |
| Test script for initializing SSI0 and writing data/commands via SPI | 121 |
| test_systick_int.c | |
| Test script for SysTick interrupts | 121 |
| test_timer1_int.c | |
| Test script for relocating the vector table to RAM | 122 |
| test_uart_interrupt.c | |
| (DISABLED) Test script for writing to serial port via UART0 | 123 |
| test_uart_la.c | |
| Test script for using a USB logic analyzer to decode UART signals | 124 |
| test_uart_write.c | |
| Test script for writing to serial port via UART0 | 124 |

[test_userctrl.c](#)

Test file for GPIO/UserCtrl modules and GPIO interrupts

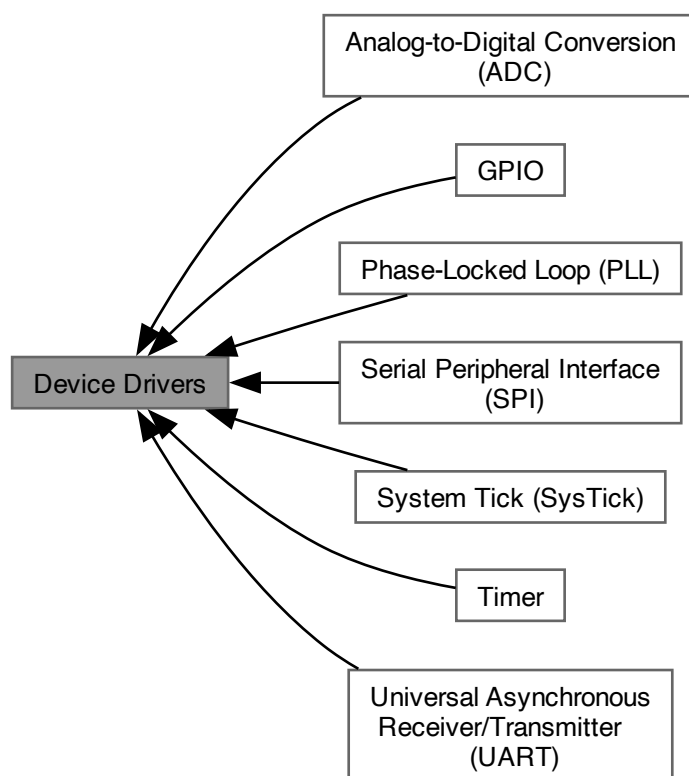

125

4 Topic Documentation

4.1 Device Drivers

Low level device driver modules.

Collaboration diagram for Device Drivers:

Modules

- [Analog-to-Digital Conversion \(ADC\)](#)
- [GPIO](#)
- [Phase-Locked Loop \(PLL\)](#)
- [Serial Peripheral Interface \(SPI\)](#)
- [System Tick \(SysTick\)](#)
- [Timer](#)
- [Universal Asynchronous Receiver/Transmitter \(UART\)](#)

4.1.1 Detailed Description

Low level device driver modules.

These modules contain functions for interfacing with peripherals available on the TM4C123GH6PM microcontroller.

4.1.2 Analog-to-Digital Conversion (ADC)

Collaboration diagram for Analog-to-Digital Conversion (ADC):

Files

- file [ADC.c](#)
Source code for ADC module.
- file [ADC.h](#)
Driver module for analog-to-digital conversion (ADC).

Functions

- void **ADC_Init** (void)
Initialize ADC0 as a single-input analog-to-digital converter.
- void **ADC_InterruptEnable** (void)
Enable the ADC interrupt.
- void **ADC_InterruptDisable** (void)
Disable the ADC interrupt.
- void **ADC_InterruptAcknowledge** (void)
Acknowledge the ADC interrupt, clearing the flag.

4.1.2.1 Detailed Description

Functions for differential-input analog-to-digital conversion.

4.1.3 GPIO

Collaboration diagram for GPIO:

Functions for using general-purpose input/output (GPIO) ports.

4.1.4 Phase-Locked Loop (PLL)

Collaboration diagram for Phase-Locked Loop (PLL):

Files

- file [PLL.c](#)
Implementation details for phase-lock-loop (PLL) functions.
- file [PLL.h](#)
Driver module for activating the phase-locked-loop (PLL).

Functions

- void **PLL_Init** (void)
Initializes the phase-locked-loop (PLL), allowing a bus frequency of 80[MHz].

4.1.4.1 Detailed Description

Function for initializing the phase-locked loop.

4.1.5 Serial Peripheral Interface (SPI)

Collaboration diagram for Serial Peripheral Interface (SPI):

Files

- file [SPI.c](#)
Source code for SPI module.
- file [SPI.h](#)
Driver module for using the serial peripheral interface (SPI) protocol.

Macros

- `#define SPI_SET_DC()` (`GPIO_PORTA_DATA_R |= 0x40`)
- `#define SPI_CLEAR_DC()` (`GPIO_PORTA_DATA_R &= ~(0x40)`)
- `#define SPI_IS_BUSY` (`SSI0_SR_R & 0x10`)
- `#define SPI_TX_ISNOTFULL` (`SSI0_SR_R & 0x02`)

Enumerations

- enum {
SPI_CLK_PIN = GPIO_PIN2 , **SPI_CS_PIN** = GPIO_PIN3 , **SPI_RX_PIN** = GPIO_PIN4 , **SPI_TX_PIN** = GPIO_PIN5 ,
SPI_DC_PIN = GPIO_PIN6 , **SPI_RESET_PIN** = GPIO_PIN7 , **SPI_SSI0_PINS** = (SPI_CLK_PIN | SPI_CS_PIN | SPI_RX_PIN | SPI_TX_PIN) , **SPI_GPIO_PINS** = (SPI_DC_PIN | SPI_RESET_PIN) ,
SPI_ALL_PINS = (SPI_SSI0_PINS | SPI_GPIO_PINS) }

Functions

- void [SPI_Init](#) (void)
Initialize SSI0 to act as an SPI Controller (AKA Master) in mode 0.
- uint8_t [SPI_Read](#) (void)
Read data from the peripheral.
- void [SPI_WriteCmd](#) (uint8_t cmd)
Write an 8-bit command to the peripheral.
- void [SPI_WriteData](#) (uint8_t data)
Write 8-bit data to the peripheral.

4.1.5.1 Detailed Description

Functions for SPI-based communication via SSI0 peripheral.

4.1.5.2 Macro Definition Documentation

SPI_SET_DC

```
#define SPI_SET_DC( ) (GPIO_PORTA_DATA_R |= 0x40)
```

| TM4C Pin | Function | ILI9341 Pin | Description |
|----------|----------|-------------|---|
| PA2 | SSI0Clk | CLK | Serial clock signal |
| PA3 | SSI0Fss | CS | Chip select signal |
| PA4 | SSI0Rx | MISO | TM4C (M) input, LCD (S) output |
| PA5 | SSI0Tx | MOSI | TM4C (M) output, LCD (S) input |
| PA6 | GPIO | D/C | Data = 1, Command = 0 |
| PA7 | GPIO | RESET | Reset the display (negative logic/active LOW) |

Clk. Polarity = steady state low (0)

Clk. Phase = rising clock edge (0)

4.1.5.3 Function Documentation

SPI_Init()

```
void SPI_Init (
    void )
```

Initialize SSI0 to act as an SPI Controller (AKA Master) in mode 0.

The bit rate BR is set using the (positive, even-numbered) clock prescale divisor $CPSDVSR$ and the SCR field in the SSI Control 0 ($CR0$) register:

$$BR = f_{bus} / (CPSDVSR * (1 + SCR))$$

The ILI9341 driver has a min. read cycle of 150 [ns] and a min. write cycle of 100 [ns], so the bit rate BR is set to be equal to the bus frequency ($f_{bus} = 80[MHz]$) divided by 8, allowing a bit rate of 10 [MHz], or a period of 100 [ns].

SPI_Read()

```
uint8_t SPI_Read (
    void )
```

Read data from the peripheral.

Returns

uint8_t

SPI_WriteCmd()

```
void SPI_WriteCmd (
    uint8_t cmd )
```

Write an 8-bit command to the peripheral.

Parameters

| | |
|------------|------------------------|
| <i>cmd</i> | command for peripheral |
|------------|------------------------|

SPI_WriteData()

```
void SPI_WriteData (
    uint8_t data )
```

Write 8-bit data to the peripheral.

Parameters

| | |
|-------------|---------------------------|
| <i>data</i> | input data for peripheral |
|-------------|---------------------------|

4.1.6 System Tick (SysTick)

Collaboration diagram for System Tick (SysTick):

Files

- file [SysTick.c](#)
Implementation details for SysTick functions.
- file [SysTick.h](#)
Driver module for using SysTick-based timing and/or interrupts.

Functions

- void **SysTick_Timer_Init** (void)
Initialize SysTick for timing purposes.
- void **SysTick_Wait1ms** (uint32_t delay_ms)
Delay for specified amount of time in [ms]. Assumes f_bus = 80[MHz].
- void [SysTick_Interrupt_Init](#) (uint32_t time_ms)
Initialize SysTick for interrupts.

4.1.6.1 Detailed Description

Functions for timing and periodic interrupts via SysTick.

4.1.6.2 Function Documentation

SysTick_Interrupt_Init()

```
void SysTick_Interrupt_Init (
    uint32_t time_ms )
```

Initialize SysTick for interrupts.

Parameters

| | |
|----------------|---|
| <i>time_ms</i> | Time in [ms] between interrupts. Cannot be more than 200[ms]. |
|----------------|---|

4.1.7 Timer

Collaboration diagram for Timer:

Files

- file [Timer.c](#)
Source code for Timer module.
- file [Timer.h](#)
Device driver for general-purpose timer modules.

Data Structures

- struct [Timer_t](#)

Typedefs

- typedef volatile uint32_t * **register_t**

Enumerations

- enum {
TIMER0_BASE = 0x40030000 , **TIMER1_BASE** = 0x40031000 , **TIMER2_BASE** = 0x40032000 , **TIMER3_**
_BASE = 0x40033000 ,
TIMER4_BASE = 0x40034000 , **TIMER5_BASE** = 0x40035000 }
- enum **REGISTER_OFFSETS** {
CONFIG = 0x00 , **MODE** = 0x04 , **CTRL** = 0x0C , **INT_MASK** = 0x18 ,
INT_CLEAR = 0x24 , **INTERVAL** = 0x28 , **VALUE** = 0x054 }
- enum **timerName_t** {
TIMER0 , **TIMER1** , **TIMER2** , **TIMER3** ,
TIMER4 , **TIMER5** }
- enum **timerMode_t** { **ONESHOT** , **PERIODIC** }
- enum { **UP** = true , **DOWN** = false }

Functions

- Timer_t **Timer_Init** (timerName_t timerName)
- timerName_t **Timer_getName** (Timer_t timer)
- void **Timer_setMode** (Timer_t timer, timerMode_t timerMode, bool isCountingUp)
- void **Timer_enableAdcTrigger** (Timer_t timer)
- void **Timer_disableAdcTrigger** (Timer_t timer)
- void **Timer_enableInterruptOnTimeout** (Timer_t timer, uint8_t priority)
- void **Timer_disableInterruptOnTimeout** (Timer_t timer)
- void **Timer_clearInterruptFlag** (Timer_t timer)
- void **Timer_setInterval_ms** (Timer_t timer, uint32_t time_ms)
- uint32_t **Timer_getCurrentValue** (Timer_t timer)
- void **Timer_Start** (Timer_t timer)
- void **Timer_Stop** (Timer_t timer)
- bool **Timer_isCounting** (Timer_t timer)
- void **Timer_Wait1ms** (Timer_t timer, uint32_t time_ms)

Variables

- static [TimerStruct_t](#) **TIMER_POOL** [6]

4.1.7.1 Detailed Description

Functions for timing and periodic interrupts via general-purpose timer modules (GPTM).

4.1.7.2 Variable Documentation

TIMER_POOL

```
TimerStruct_t TIMER_POOL[6] [static]
```

Initial value:

```
= {
    { TIMER0, TIMER0_BASE, (register_t) (TIMER0_BASE + CTRL), (register_t) (TIMER0_BASE + INTERVAL),
      (register_t) (TIMER0_BASE + INT_CLEAR), false },
    { TIMER1, TIMER1_BASE, (register_t) (TIMER1_BASE + CTRL), (register_t) (TIMER1_BASE + INTERVAL),
      (register_t) (TIMER1_BASE + INT_CLEAR), false },
    { TIMER2, TIMER2_BASE, (register_t) (TIMER2_BASE + CTRL), (register_t) (TIMER2_BASE + INTERVAL),
      (register_t) (TIMER2_BASE + INT_CLEAR), false },
    { TIMER3, TIMER3_BASE, (register_t) (TIMER3_BASE + CTRL), (register_t) (TIMER3_BASE + INTERVAL),
      (register_t) (TIMER3_BASE + INT_CLEAR), false },
    { TIMER4, TIMER4_BASE, (register_t) (TIMER4_BASE + CTRL), (register_t) (TIMER4_BASE + INTERVAL),
      (register_t) (TIMER4_BASE + INT_CLEAR), false },
    { TIMER5, TIMER5_BASE, (register_t) (TIMER5_BASE + CTRL), (register_t) (TIMER5_BASE + INTERVAL),
      (register_t) (TIMER5_BASE + INT_CLEAR), false }
}
```

4.1.8 Universal Asynchronous Receiver/Transmitter (UART)

Collaboration diagram for Universal Asynchronous Receiver/Transmitter (UART):

Files

- file [UART.c](#)
Source code for UART module.
- file [UART.h](#)
Driver module for serial communication via UART0 and UART 1.

Data Structures

- struct [UART_t](#)

Macros

- `#define ASCII_CONVERSION 0x30`

Typedefs

- `typedef volatile uint32_t * register_t`

Enumerations

- enum **GPIO_BASE_ADDRESSES** {
 GPIO_PORTA_BASE = (uint32_t) 0x40004000 , **GPIO_PORTB_BASE** = (uint32_t) 0x40005000 , **GPIO_PORTC_BASE** = (uint32_t) 0x40006000 , **GPIO_PORTD_BASE** = (uint32_t) 0x40007000 ,

- enum **UART_Num_t** {
 UART0 , **UART1** , **UART2** , **UART3** ,
 UART4 , **UART5** , **UART6** , **UART7** }

Functions

- `UART_t * UART_Init (GPIO_Port_t *port, UART_Num_t uartNum)`
Initialize the specified UART peripheral.
- `unsigned char UART_ReadChar (UART_t *uart)`
Read a single ASCII character from the UART.
- `void UART_WriteChar (UART_t *uart, unsigned char input_char)`
Write a single character to the UART.
- `void UART_WriteStr (UART_t *uart, void *input_str)`
Write a C string to the UART.
- `void UART_WriteInt (UART_t *uart, int32_t n)`
Write a 32-bit unsigned integer the UART.
- `void UART_WriteFloat (UART_t *uart, double n, uint8_t num_decimals)`
Write a floating-point number the UART.

Variables

- static `UART_t UART_ARR [8]`

4.1.8.1 Detailed Description

Functions for UART-based communication.

4.1.8.2 Function Documentation

UART_Init()

```
UART_t * UART_Init (
    GPIO_Port_t * port,
    UART_Num_t uartNum )
```

Initialize the specified UART peripheral.

Parameters

| | | |
|-----|----------------|--|
| in | <i>port</i> | GPIO port to use. |
| in | <i>uartNum</i> | UART number. Should be either one of the enumerated constants or an int in range [0, 7]. |
| out | <i>UART_t*</i> | (Pointer to) initialized UART peripheral. |

Given the bus frequency (f_{bus}) and desired baud rate (BR), the baud rate divisor (BRD) can be calculated:

$$BRD = f_{bus} / (16 * BR)$$

The integer BRD ($IBRD$) is simply the integer part of the BRD: $IBRD = int(BRD)$

The fractional BRD ($FBRD$) is calculated using the fractional part ($mod(BRD, 1)$) of the BRD: $FBRD = int((mod(BRD, 1) * 64) + 0.5)$

UART_ReadChar()

```
unsigned char UART_ReadChar (
    UART_t * uart )
```

Read a single ASCII character from the UART.

Parameters

| | | |
|-----|-----------------|-----------------------------------|
| in | <i>uart</i> | UART to read from. |
| out | <i>unsigned</i> | char ASCII character from sender. |

UART_WriteChar()

```
void UART_WriteChar (
    UART_t * uart,
    unsigned char input_char )
```

Write a single character to the UART.

Parameters

| | | |
|----|-------------------|--------------------------|
| in | <i>uart</i> | UART to read from. |
| in | <i>input_char</i> | ASCII character to send. |

UART_WriteStr()

```
void UART_WriteStr (
    UART_t * uart,
    void * input_str )
```

Write a C string to the UART.

Parameters

| | | |
|----|------------------|----------------------------|
| in | <i>uart</i> | UART to read from. |
| in | <i>input_str</i> | Array of ASCII characters. |

UART_WriteInt()

```
void UART_WriteInt (
    UART_t * uart,
    int32_t n )
```

Write a 32-bit unsigned integer the UART.

Parameters

| | | |
|----|-------------|--|
| in | <i>uart</i> | UART to read from. |
| in | <i>n</i> | Unsigned 32-bit int to be converted and transmitted. |

UART_WriteFloat()

```
void UART_WriteFloat (
    UART_t * uart,
    double n,
    uint8_t num_decimals )
```

Write a floating-point number the UART.

Parameters

| | | |
|----|---------------------|--|
| in | <i>uart</i> | UART to read from. |
| in | <i>n</i> | Floating-point number to be converted and transmitted. |
| in | <i>num_decimals</i> | Number of digits after the decimal point to include. |

4.1.8.3 Variable Documentation**UART_ARR**

```
UART_t UART_ARR[8] [static]
```

Initial value:

```
= {
    { UART0_BASE, ((register_t) (UART0_BASE + UART_FR_R_OFFSET)), 0, GPIO_PIN0, GPIO_PIN1, false },
    { UART1_BASE, ((register_t) (UART1_BASE + UART_FR_R_OFFSET)), 0, GPIO_PIN0, GPIO_PIN1, false },
    { UART2_BASE, ((register_t) (UART2_BASE + UART_FR_R_OFFSET)), 0, GPIO_PIN6, GPIO_PIN7, false },
    { UART3_BASE, ((register_t) (UART3_BASE + UART_FR_R_OFFSET)), 0, GPIO_PIN6, GPIO_PIN7, false },
    { UART4_BASE, ((register_t) (UART4_BASE + UART_FR_R_OFFSET)), 0, GPIO_PIN4, GPIO_PIN5, false },
    { UART5_BASE, ((register_t) (UART5_BASE + UART_FR_R_OFFSET)), 0, GPIO_PIN4, GPIO_PIN5, false },
    { UART6_BASE, ((register_t) (UART6_BASE + UART_FR_R_OFFSET)), 0, GPIO_PIN4, GPIO_PIN5, false },
    { UART7_BASE, ((register_t) (UART7_BASE + UART_FR_R_OFFSET)), 0, GPIO_PIN0, GPIO_PIN1, false }
}
```

4.2 Middleware

High-level device driver modules.

Collaboration diagram for Middleware:

Modules

- [ILI9341](#)
- [LED](#)

4.2.1 Detailed Description

High-level device driver modules.

These modules contain functions for interfacing with external devices/peripherals via the use of low-level drivers.

4.2.2 ILI9341

Collaboration diagram for ILI9341:

Files

- file [ILI9341.c](#)
Source code for ILI9341 module.
- file [ILI9341.h](#)
Driver module for interfacing with an ILI9341 LCD driver.

Macros

- `#define NUM_COLS (uint16_t) 240`
- `#define NUM_ROWS (uint16_t) 320`

Enumerations

- enum `Cmd_t` {
`NOP` = 0x00 , `SWRESET` = 0x01 , `SPLIN` = 0x10 , `SPLOUT` = 0x11 ,
`PTLON` = 0x12 , `NORON` = 0x13 , `DINVOFF` = 0x20 , `DINVON` = 0x21 ,
`CASET` = 0x2A , `PASET` = 0x2B , `RAMWR` = 0x2C , `DISPOFF` = 0x28 ,
`DISPON` = 0x29 , `PLTAR` = 0x30 , `VSCRDEF` = 0x33 , `MADCTL` = 0x36 ,
`VSCRADD` = 0x37 , `IDMOFF` = 0x38 , `IDMON` = 0x39 , `PIXSET` = 0x3A ,
`FRMCTR1` = 0xB1 , `FRMCTR2` = 0xB2 , `FRMCTR3` = 0xB3 , `PRCTR` = 0xB5 ,
`IFCTL` = 0xF6 }

Functions

- static void [ILI9341_setAddress](#) (uint16_t start_address, uint16_t end_address, bool is_row)
- static void [ILI9341_sendParams](#) (Cmd_t cmd)

Send a command and/or the data within the FIFO buffer. A command is only sent when cmd != NOP (where NOP = 0). Data is only sent if the FIFO buffer is not empty.
- void [ILI9341_Init](#) (Timer_t timer)

Initialize the LCD driver, the SPI module, and Timer2A.
- void [ILI9341_resetHard](#) (Timer_t timer)

Perform a hardware reset of the LCD driver.
- void [ILI9341_resetSoft](#) (Timer_t timer)

Perform a software reset of the LCD driver.
- void [ILI9341_setSleepMode](#) (bool isSleeping, Timer_t timer)

Enter or exit sleep mode. The LCD driver is in sleep mode by default upon powering on or either kind of reset.
- void [ILI9341_setDispMode](#) (bool isNormal, bool isFullColors)

Set the display area and color expression.
- void [ILI9341_setPartialArea](#) (uint16_t rowStart, uint16_t rowEnd)

Set the partial display area for partial mode. Call before activating partial mode via ILI9341_setDisplayMode().
- void [ILI9341_setDispInversion](#) (bool is_ON)

Toggle display inversion. Turning ON causes colors to be inverted on the display.
- void [ILI9341_setDispOutput](#) (bool is_ON)

Turn display output ON or OFF. This function clears the display and stops outputting to the display area, but does not affect frame memory or power.
- void [ILI9341_setScrollArea](#) (uint16_t topFixedArea, uint16_t vertScrollArea, uint16_t bottFixedArea)

Set the vertical scrolling area of the display. The sum of the three parameters should be equal to the max number of rows NUM_ROWS = 320.
- void [ILI9341_setScrollStart](#) (uint16_t startRow)

Set the start row for vertical scrolling.
- void [ILI9341_setMemAccessCtrl](#) (bool areRowsFlipped, bool areColsFlipped, bool areRowsAndColsSwitched, bool isVertRefreshFlipped, bool isColorOrderFlipped, bool isHorRefreshFlipped)

Set how data is converted from memory to display.
- void [ILI9341_setColorDepth](#) (bool is_16bit)

Set the pixel format to be 16-bit (65K colors) or 18-bit (262K colors).
- void [ILI9341_NoOpCmd](#) (void)

Send the "No Operation" command (NOP = 0x00) to the LCD driver. Can be used to terminate the "Memory Write" (RAMWR) and "Memory Read" (RAMRD) commands, but does nothing otherwise.
- void [ILI9341_setFrameRateNorm](#) (uint8_t divisionRatio, uint8_t clocksPerLine)

TODO: Write brief.
- void [ILI9341_setFrameRateIdle](#) (uint8_t divisionRatio, uint8_t clocksPerLine)

TODO: Write brief.
- void [ILI9341_setInterface](#) (void)

Sets the interface for the ILI9341. The parameters for this command are hard-coded, so it only needs to be called once upon initialization.
- void [ILI9341_setRowAddress](#) (uint16_t startRow, uint16_t endRow)

not using backlight, so these aren't necessary
- void [ILI9341_setColAddress](#) (uint16_t startCol, uint16_t endCol)

Sets the start/end rows to be written to.
- void [ILI9341_writeMemCmd](#) (void)

Sends the "Write Memory" (RAMWR) command to the LCD driver, signalling that incoming data should be written to memory.
- void [ILI9341_writePixel](#) (uint8_t red, uint8_t green, uint8_t blue, bool is_16bit)

Write a single pixel to frame memory.
- void [ILI9341_setBlankingPorch](#) (uint8_t vpf, uint8_t vbp, uint8_t hfp, uint8_t hbp)

TODO: Write.

Variables

- static uint32_t [ILI9341_Buffer](#) [8]
- static [FIFO_t](#) * [ILI9341_Fifo](#)

4.2.2.1 Detailed Description

Functions for interfacing an ILI9341-based 240RGBx320 LCD via [Serial Peripheral Interface \(SPI\)](#).

4.2.2.2 Enumeration Type Documentation

Cmd_t

enum [Cmd_t](#)

Enumerator

| | |
|----------|---------------------------------------|
| SWRESET | No Operation. |
| SPLIN | Software Reset. |
| SPLOUT | Enter Sleep Mode. |
| PTLON | Sleep Out (i.e. Exit Sleep Mode) |
| NORON | Partial Display Mode ON. |
| DINVOFF | Normal Display Mode ON. |
| DINVON | Display Inversion OFF. |
| CASET | Display Inversion ON. |
| PASET | Column Address Set. |
| RAMWR | Page Address Set. |
| DISPOFF | Memory Write. |
| DISPON | Display OFF. |
| PLTAR | Display ON. |
| VSCRDEF | Partial Area. |
| MADCTL | Vertical Scrolling Definition. |
| VSCRSADD | Memory Access Control. |
| IDMOFF | Vertical Scrolling Start Address. |
| IDMON | Idle Mode OFF. |
| PIXSET | Idle Mode ON. |
| FRMCTR1 | Pixel Format Set. |
| FRMCTR2 | Frame Rate Control Set (Normal Mode) |
| FRMCTR3 | Frame Rate Control Set (Idle Mode) |
| PRCTR | Frame Rate Control Set (Partial Mode) |
| IFCTL | Blanking Porch Control. |

4.2.2.3 Function Documentation

ILI9341_setAddress()

```
static void ILI9341_setAddress (
    uint16_t start_address,
```

```
uint16_t end_address,  
bool is_row ) [inline], [static]
```

This function implements the "Column Address Set" (CASET) and "Page Address Set" (PASET) commands from p. 110-113 of the ILI9341 datasheet.

The input parameters represent the first and last addresses to be written to when `ILI9341_writePixel()` is called.

To work correctly, `startAddress` must be no greater than `endAddress`, and `endAddress` cannot be greater than the max number of rows/columns.

ILI9341_sendParams()

```
static void ILI9341_sendParams (  
    Cmd_t cmd ) [inline], [static]
```

Send a command and/or the data within the FIFO buffer. A command is only sent when `cmd != NOP` (where `NOP = 0`). Data is only sent if the FIFO buffer is not empty.

Parameters

| | | |
|----|------------|------------------|
| in | <i>cmd</i> | Command to send. |
|----|------------|------------------|

ILI9341_resetHard()

```
void ILI9341_resetHard (  
    Timer_t timer )
```

Perform a hardware reset of the LCD driver.

The LCD driver's RESET pin requires a negative logic (i.e. active `LOW`) signal for ≥ 10 [us] and an additional 5 [ms] before further commands can be sent.

ILI9341_resetSoft()

```
void ILI9341_resetSoft (  
    Timer_t timer )
```

Perform a software reset of the LCD driver.

the driver needs 5 [ms] before another command

ILI9341_setSleepMode()

```
void ILI9341_setSleepMode (  
    bool isSleeping,  
    Timer_t timer )
```

Enter or exit sleep mode. The LCD driver is in sleep mode by default upon powering on or either kind of reset.

Parameters

| | |
|-------------------|---|
| <i>isSleeping</i> | true to enter sleep mode, false to exit |
|-------------------|---|

This function turns sleep mode ON or OFF depending on the value of *is_sleeping*. Either way, the MCU must wait ≥ 5 [ms] before sending further commands.

It's also necessary to wait 120 [ms] before sending *SPLOUT* after sending *SPLIN* or a reset, so this function waits 120 [ms] regardless of the preceding event.

ILI9341_setDispMode()

```
void ILI9341_setDispMode (
    bool isNormal,
    bool isFullColors )
```

Set the display area and color expression.

Normal mode is the default and allows output to the full display area. Partial mode should be activated after calling `'ILI9341_setPartialArea()'`.

Setting `'isFullColors'` to `'false'` restricts the color expression to 8 colors, determined by the MSB of the R/G/B values.

Parameters

| | |
|---------------------|--|
| <i>isNormal</i> | true for normal mode, false for partial mode |
| <i>isFullColors</i> | true for full colors, false for 8 colors |

ILI9341_setPartialArea()

```
void ILI9341_setPartialArea (
    uint16_t rowStart,
    uint16_t rowEnd )
```

Set the partial display area for partial mode. Call before activating partial mode via `ILI9341_setDisplayMode()`.

Parameters

| | |
|-----------------|--|
| <i>rowStart</i> | |
| <i>rowEnd</i> | |

ILI9341_setDispInversion()

```
void ILI9341_setDispInversion (
    bool is_ON )
```

Toggle display inversion. Turning ON causes colors to be inverted on the display.

Parameters

| | |
|--------------|------------------------------------|
| <i>is_ON</i> | true to turn ON, false to turn OFF |
|--------------|------------------------------------|

TODO: Write description

ILI9341_setDispOutput()

```
void ILI9341_setDispOutput (
    bool is_ON )
```

Turn display output ON or OFF. This function clears the display and stops outputting to the display area, but does not affect frame memory or power.

Parameters

| | |
|--------------|------------------------------------|
| <i>is_ON</i> | true to turn ON, false to turn OFF |
|--------------|------------------------------------|

TODO: Write description

ILI9341_setScrollArea()

```
void ILI9341_setScrollArea (
    uint16_t topFixedArea,
    uint16_t vertScrollArea,
    uint16_t bottFixedArea )
```

Set the vertical scrolling area of the display. The sum of the three parameters should be equal to the max number of rows `NUM_ROWS = 320`.

Parameters

| | |
|-----------------------|---|
| <i>topFixedArea</i> | Number of rows fixed at the top of the screen. |
| <i>vertScrollArea</i> | Number of rows that scroll. |
| <i>bottFixedArea</i> | Number of rows fixed at the bottom of the screen. |

ILI9341_setScrollStart()

```
void ILI9341_setScrollStart (
    uint16_t startRow )
```

Set the start row for vertical scrolling.

Parameters

| | |
|-----------------|---|
| <i>startRow</i> | Start row for scrolling. Should be $\geq \text{topFixedArea} - 1$ |
|-----------------|---|

ILI9341_setMemAccessCtrl()

```
void ILI9341_setMemAccessCtrl (
    bool areRowsFlipped,
    bool areColsFlipped,
    bool areRowsAndColsSwitched,
    bool isVertRefreshFlipped,
    bool isColorOrderFlipped,
    bool isHorRefreshFlipped )
```

Set how data is converted from memory to display.

Parameters

| | | |
|----|-------------------------------|--|
| in | <i>areRowsFlipped</i> | |
| in | <i>areColsFlipped</i> | |
| in | <i>areRowsAndColsSwitched</i> | |
| in | <i>isVertRefreshFlipped</i> | |
| in | <i>isColorOrderFlipped</i> | |
| in | <i>isHorRefreshFlipped</i> | |

This function implements the "Memory Access Control" (MADCTL) command from p. 127-128 of the ILI9341 datasheet, which controls how the LCD driver displays data upon writing to memory.

| Name | Bit # | Effect when set = 1 |
|------|-------|--|
| MY | 7 | flip row (AKA "page") addresses |
| MX | 6 | flip column addresses |
| MV | 5 | exchange rows and column addresses |
| ML | 4 | reverse horizontal refresh order |
| BGR | 3 | reverse color input order (RGB -> BGR) |
| MH | 2 | reverse vertical refresh order |

All bits are clear after powering on or HWRESET.

ILI9341_setColorDepth()

```
void ILI9341_setColorDepth (
    bool is_16bit )
```

Set the pixel format to be 16-bit (65K colors) or 18-bit (262K colors).

Parameters

| | |
|-----------------|--|
| <i>is_16bit</i> | |
|-----------------|--|

16-bit requires 2 transfers and allows for 65K colors. 18-bit requires 3 transfers and allows for 262K colors.

ILI9341_setFrameRateNorm()

```
void ILI9341_setFrameRateNorm (
```

```
uint8_t divisionRatio,
uint8_t clocksPerLine )
```

TODO: Write brief.

TODO: Write description

ILI9341_setFrameRateIdle()

```
void ILI9341_setFrameRateIdle (
    uint8_t divisionRatio,
    uint8_t clocksPerLine )
```

TODO: Write brief.

TODO: Write description

ILI9341_setInterface()

```
void ILI9341_setInterface (
    void )
```

Sets the interface for the ILI9341. The parameters for this command are hard-coded, so it only needs to be called once upon initialization.

This function implements the "Interface Control" IFCTL command from p. 192-194 of the ILI9341 datasheet, which controls how the LCD driver handles 16-bit data and what interfaces (internal or external) are used.

| Name | Bit # | Param # | Effect when set = 1 |
|----------|-------|---------|---|
| MY_EOR | 7 | 0 | flips value of corresponding MADCTL bit |
| MX_EOR | 6 | | flips value of corresponding MADCTL bit |
| MV_EOR | 5 | | flips value of corresponding MADCTL bit |
| BGR_EOR | 3 | | flips value of corresponding MADCTL bit |
| WEMODE | 0 | | overflowing pixel data is not ignored |
| EPF[1:0] | 5:4 | 1 | controls 16 to 18-bit pixel data conversion |
| MDT[1:0] | 1:0 | | controls display data transfer method |
| ENDIAN | 5 | 2 | host sends LSB first |
| DM[1:0] | 3:2 | | selects display operation mode |
| RM | 1 | | selects GRAM interface mode |
| RIM | 0 | | specifies RGB interface-specific details |

The first param's bits are cleared so that the corresponding MADCTL bits (ILI9341_setMemoryAccessCtrl()) are unaffected and overflowing pixel data is ignored. The EPF bits are cleared so that the LSB of the R and B values is copied from the MSB when using 16-bit color depth. The TM4C123 sends the MSB first, so the ENDIAN bit is cleared. The other bits are cleared and/or irrelevant since the RGB and VSYNC interfaces aren't used.

ILI9341_setRowAddress()

```
void ILI9341_setRowAddress (
    uint16_t startRow,
    uint16_t endRow )
```

not using backlight, so these aren't necessary

Sets the start/end rows to be written to.

Should be called along with `'ILI9341_setColAddress()'` and before `'ILI9341_writeMemCmd()'`.

Parameters

| | |
|-----------------|---|
| <i>startRow</i> | <code>0 <= startRow <= endRow</code> |
| <i>endRow</i> | <code>startRow <= endRow < 320</code> |

This function is simply an interface to [ILI9341_setAddress\(\)](#). To work correctly, `start_row` must be no greater than `end_row`, and `end_row` cannot be greater than the max row number (default 320).

ILI9341_setColAddress()

```
void ILI9341_setColAddress (
    uint16_t startCol,
    uint16_t endCol )
```

Sets the start/end rows to be written to.

Should be called along with `'ILI9341_setRowAddress()'` and before `'ILI9341_writeMemCmd()'`.

Parameters

| | |
|-----------------|---|
| <i>startCol</i> | <code>0 <= startCol <= endCol</code> |
| <i>endCol</i> | <code>startCol <= endCol < 240</code> |

This function is simply an interface to [ILI9341_setAddress\(\)](#). To work correctly, `start_col` must be no greater than `end_col`, and `end_col` cannot be greater than the max column number (default 240).

ILI9341_writeMemCmd()

```
void ILI9341_writeMemCmd (
    void )
```

Sends the "Write Memory" (RAMWR) command to the LCD driver, signalling that incoming data should be written to memory.

Should be called after setting the row ([ILI9341_setRowAddress\(\)](#)) and/or and/or column ([ILI9341_setRowAddress\(\)](#)) addresses, but before writing image data ([ILI9341_writePixel\(\)](#)).

ILI9341_writePixel()

```
void ILI9341_writePixel (
    uint8_t red,
    uint8_t green,
    uint8_t blue,
    bool is_16bit )
```

Write a single pixel to frame memory.

Call `'ILI9341_writeMemCmd()'` before this one.

Parameters

| | |
|-----------------|---|
| <i>red</i> | 5 or 6-bit R value |
| <i>green</i> | 5 or 6-bit G value |
| <i>blue</i> | 5 or 6-bit B value |
| <i>is_16bit</i> | true for 16-bit (65K colors, 2 transfers) color depth, false for 18-bit (262K colors, 3 transfer) color depth NOTE: set color depth via ILI9341_setColorDepth() |

This function sends one pixel to the display. Because the serial interface (SPI) is used, each pixel requires 2 transfers in 16-bit mode and 3 transfers in 18-bit mode.

The following table (adapted from p. 63 of the datasheet) visualizes how the RGB data is sent to the display when using 16-bit color depth.

| Transfer | 1 | | | | | | | | 2 | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit # | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Value | R4 | R3 | R2 | R1 | R0 | G5 | G4 | G3 | G2 | G1 | G0 | B4 | B3 | B2 | B1 | B0 |

The following table (adapted from p. 64 of the datasheet) visualizes how the RGB data is sent to the display when using 18-bit color depth.

| Transfer | 1 | | | | | | | | 2 | | |
|----------|----|----|----|----|----|----|-----|-----|----|----|-----|
| Bit # | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | 7 | 6 | ... |
| Value | R5 | R4 | R3 | R2 | R1 | R0 | 0/1 | 0/1 | G5 | G4 | ... |

4.2.2.4 Variable Documentation**ILI9341_Buffer**

```
uint32_t ILI9341_Buffer[8] [static]
```

Currently unused commands #define RDDST (uint8_t) 0x09 /// Read Display Status #define RDDMADCTL (uint8_t) 0x0B /// Read Display MADCTL #define RDDCOLMOD (uint8_t) 0x0C /// Read Display Pixel Format #define RGBSET (uint8_t) 0x2D /// Color Set #define RAMRD (uint8_t) 0x2E /// Memory Read #define WRITE_MEMORY_CONTINUE (uint8_t) 0x3C /// Write_Memory_Continue #define READ_MEMORY_CONTINUE (uint8_t) 0x3E /// Read_Memory_Continue #define WRDISBV (uint8_t) 0x51 /// Write Display Brightness #define RDDISBV (uint8_t) 0x52 /// Read Display Brightness #define IFMODE (uint8_t) 0xB0 /// RGB Interface Signal Control (i.e. Interface Mode Control) #define INVTR (uint8_t) 0xB4 /// Display Inversion Control

4.2.3 LED

Collaboration diagram for LED:

Files

- file [Led.c](#)
Source code for LED module.

Turn the LED ON.
- `void Led_TurnOff (Led_t *led)`
Turn the LED OFF.
- `void Led_Toggle (Led_t *led)`
Toggle the LED (i.e. OFF -> ON or ON -> OFF).

Variables

- static `Led_t Led_ObjPool [LED_POOL_SIZE] = { 0 }`
- static `uint8_t num_free_leds = LED_POOL_SIZE`

4.2.3.1 Detailed Description

Functions for driving light-emitting diodes (LEDs) via [GPIO](#).

4.2.3.2 Function Documentation

Led_Init()

```
Led_t * Led_Init (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pin )
```

Initialize a light-emitting diode (LED) as an [Led_t](#).

Parameters

| | | |
|-----|-----------------|---|
| in | <i>gpioPort</i> | Pointer to a struct representing a GPIO port. |
| in | <i>pin</i> | GPIO pin to use. |
| out | <i>Led_t*</i> | Pointer to LED data structure. |

Led_GetPort()

```
GPIO_Port_t * Led_GetPort (
    Led_t * led )
```

Get the GPIO port associated with the LED.

Parameters

| | | |
|-----|---------------------|--|
| in | <i>led</i> | Pointer to LED data structure. |
| out | <i>GPIO_Port_t*</i> | Pointer to a GPIO port data structure. |

Led_GetPin()

```
GPIO_Pin_t Led_GetPin (
    Led_t * led )
```

Get the GPIO pin associated with the LED.

Parameters

| | | |
|-----|-------------------|-----------------------------------|
| in | <i>led</i> | Pointer to LED data structure. |
| out | <i>GPIO_Pin_t</i> | GPIO pin associated with the LED. |

Led_isOn()

```
bool Led_isOn (
    Led_t * led )
```

Check the LED's status.

Parameters

| | | |
|-----|--------------|--------------------------------|
| in | <i>led</i> | Pointer to LED data structure. |
| out | <i>true</i> | the LED is ON. |
| out | <i>false</i> | the LED is OFF. |

Led_TurnOn()

```
void Led_TurnOn (
    Led_t * led )
```

Turn the LED ON.

Parameters

| | | |
|----|------------|--------------------------------|
| in | <i>led</i> | Pointer to LED data structure. |
|----|------------|--------------------------------|

Led_TurnOff()

```
void Led_TurnOff (
    Led_t * led )
```

Turn the LED OFF.

Parameters

| | | |
|----|------------|--------------------------------|
| in | <i>led</i> | Pointer to LED data structure. |
|----|------------|--------------------------------|

Led_Toggle()

```
void Led_Toggle (
    Led_t * led )
```

Toggle the LED (i.e. OFF -> ON or ON -> OFF).

Parameters

| | | |
|----|------------|--------------------------------|
| in | <i>led</i> | Pointer to LED data structure. |
|----|------------|--------------------------------|

4.3 Application Software

Application-specific software modules.

Collaboration diagram for Application Software:

Modules

- [Data Acquisition \(DAQ\)](#)
- [Debug](#)
- [LCD](#)
- [QRS](#)

4.3.1 Detailed Description

Application-specific software modules.

These modules contain functions specifically built for this project's purposes.

4.3.2 Data Acquisition (DAQ)

Collaboration diagram for Data Acquisition (DAQ):

Files

- file [DAQ.c](#)
Source code for DAQ module.
- file [DAQ.h](#)
Application software for handling data acquisition (DAQ) functions.
- file [lookup.c](#)
Source code for DAQ module's lookup table.
- file [lookup.h](#)
Lookup table for DAQ module.

Macros

- `#define SAMPLING_PERIOD_MS 5`
sampling period in ms ($T_s = 1/f_s$)
- `#define LOOKUP_DAQ_MAX (float32_t) 5.5`
- `#define LOOKUP_DAQ_MIN (float32_t)(-5.5)`

Typedefs

- `typedef arm_biquad_casd_df1_inst_f32 Filter_t`

Enumerations

- enum {
`NUM_STAGES_NOTCH = 6 , NUM_COEFFS_NOTCH = NUM_STAGES_NOTCH * 5 , STATE_BUFF_SIZE_NOTCH = NUM_STAGES_NOTCH * 4 , NUM_STAGES_BANDPASS = 4 ,`
`NUM_COEFFS_DAQ_BANDPASS = NUM_STAGES_BANDPASS * 5 , STATE_BUFF_SIZE_BANDPASS = NUM_STAGES_BANDPASS * 4 }`

Functions

- `const float32_t * Lookup_GetPtr (void)`
Return a pointer to the DAQ lookup table.

Variables

- `static const float32_t * DAQ_LOOKUP_TABLE = 0`
- `static const float32_t COEFFS_NOTCH [NUM_COEFFS_NOTCH]`
- `static const float32_t COEFFS_BANDPASS [NUM_COEFFS_DAQ_BANDPASS]`
- `static float32_t stateBuffer_Notch [STATE_BUFF_SIZE_NOTCH]`
- `static const Filter_t notchFiltStruct = { NUM_STAGES_NOTCH, stateBuffer_Notch, COEFFS_NOTCH }`
- `static const Filter_t *const notchFilter = ¬chFiltStruct`
- `static float32_t stateBuffer_Bandpass [STATE_BUFF_SIZE_BANDPASS]`
- `static const Filter_t bandpassFiltStruct`
- `static const Filter_t *const bandpassFilter = &bandpassFiltStruct`
- `static const float32_t LOOKUP_DAQ_TABLE [4096]`

Lookup table for converting ADC data from unsigned 12-bit integer values to 32-bit floating point values.

Initialization

- void `DAQ_Init` (void)
Initialize the data acquisition (DAQ) module.

Reading Input Data

- uint16_t `DAQ_readSample` (void)
Read a sample from the ADC.
- float32_t `DAQ_convertToMilliVolts` (uint16_t sample)
Convert a 12-bit ADC sample to a floating-point voltage value via LUT.

Digital Filtering Functions

- float32_t `DAQ_NotchFilter` (volatile float32_t xn)
Apply a 60 [Hz] notch filter to an input sample.
- float32_t `DAQ_BandpassFilter` (volatile float32_t xn)
Apply a 0.5-40 [Hz] bandpass filter to an input sample.

4.3.2.1 Detailed Description

Module for managing data acquisition (DAQ) functions.

4.3.2.2 Function Documentation

`DAQ_Init()`

```
void DAQ_Init (  
    void )
```

Initialize the data acquisition (DAQ) module.

Postcondition

The ADC and Timer are initialized, and the DAQ module has access to its lookup table (LUT).

`DAQ_readSample()`

```
uint16_t DAQ_readSample (  
    void )
```

Read a sample from the ADC.

Precondition

Initialize the DAQ module.

This should be used in an interrupt handler and/or at a consistent rate (i.e. the sampling frequency).

Parameters

| | | |
|-----|---------------|---------------------------------------|
| out | <i>sample</i> | 12-bit sample in range [0x000, 0xFFF] |
|-----|---------------|---------------------------------------|

Postcondition

The sample can now be converted to millivolts.

See also

[DAQ_convertToMilliVolts\(\)](#)

DAQ_convertToMilliVolts()

```
float32_t DAQ_convertToMilliVolts (
    uint16_t sample )
```

Convert a 12-bit ADC sample to a floating-point voltage value via LUT.

Precondition

Read a sample from the ADC.

Parameters

| | | |
|-----|---------------|--|
| in | <i>sample</i> | 12-bit sample in range [0x000, 0xFFF] |
| out | <i>xn</i> | Voltage value in range $[-5.5, 5.5]mV$ |

Postcondition

The sample $x[n]$ is ready for filtering.

See also

[DAQ_readSample\(\)](#)

DAQ_NotchFilter()

```
float32_t DAQ_NotchFilter (
    volatile float32_t xn )
```

Apply a 60 [Hz] notch filter to an input sample.

Precondition

Read a sample from the ADC and convert it to millivolts.

Parameters

| | | |
|-----|------|------------------------|
| in | xn | Raw input sample |
| out | yn | Filtered output sample |

Postcondition

The sample $y[n]$ is ready for analysis and/or further processing.

See also

[DAQ_BandpassFilter\(\)](#)

DAQ_BandpassFilter()

```
float32_t DAQ_BandpassFilter (  
    volatile float32_t xn )
```

Apply a 0.5-40 [Hz] bandpass filter to an input sample.

Precondition

Read a sample from the ADC and convert it to millivolts.

Parameters

| | | |
|-----|------|------------------------|
| in | xn | Input sample |
| out | yn | Filtered output sample |

Postcondition

The sample $y[n]$ is ready for analysis and/or further processing.

See also

[DAQ_NotchFilter\(\)](#)

Lookup_GetPtr()

```
const float32_t * Lookup_GetPtr (  
    void )
```

Return a pointer to the DAQ lookup table.

Returns

const float32_t*

4.3.2.3 Variable Documentation

COEFS_NOTCH

```
const float32_t COEFS_NOTCH[NUM_COEFS_NOTCH] [static]
```

Initial value:

```
= {
    0.8856732845306396f, 0.5476464033126831f, 0.8856732845306396f,

```

bandpassFiltStruct

```
const Filter_t bandpassFiltStruct [static]
```

Initial value:

```
= { NUM_STAGES_BANDPASS, stateBuffer_Bandpass,
    COEFS_BANDPASS }
```

4.3.3 Debug

Collaboration diagram for Debug:

Files

- file [Debug.h](#)

Functions to output debugging information to a serial port via UART.

Serial Output

- enum **Msg_t** { **DEBUG_DAQ_INIT** , **DEBUG_QRS_INIT** , **DEBUG_LCD_INIT** , **DEBUG_QRS_START** }
- void [Debug_SendMsg](#) (void *message)
Send a message to the serial port.
- void [Debug_SendFromList](#) (Msg_t msg)
Send a message from the message list.
- void [Debug_WriteFloat](#) (double value)
Write a floating-point value to the serial port.

Initialization

- void [Debug_Init](#) (void)
Initialize the Debug module.

Assertions

- void [Debug_Assert](#) (bool condition)
*Stops program if *condition* is *true*. Useful for bug detection during debugging.*

4.3.3.1 Detailed Description

Module for debugging functions, including serial output and assertion.

4.3.3.2 Function Documentation

Debug_Init()

```
void Debug_Init (  
    void )
```

Initialize the Debug module.

Postcondition

An initialization message is sent to the serial port (UART0).

Debug_SendMsg()

```
void Debug_SendMsg (  
    void * message )
```

Send a message to the serial port.

Precondition

Initialize the Debug module.

Parameters

| | |
|----------------|---|
| <i>message</i> | (Pointer to) array of ASCII characters. |
|----------------|---|

Postcondition

A floating point value is written to the serial port.

See also

[Debug_SendMsg\(\)](#)

Debug_SendFromList()

```
void Debug_SendFromList (
    Msg_t msg )
```

Send a message from the message list.

Precondition

Initialize the Debug module.

Parameters

| | | |
|----|------------|------------------|
| in | <i>msg</i> | Message to send. |
|----|------------|------------------|

Postcondition

One of the messages

See also

[Debug_SendMsg\(\)](#)

Debug_WriteFloat()

```
void Debug_WriteFloat (
    double value )
```

Write a floating-point value to the serial port.

Precondition

Initialize the Debug module.

Parameters

| | | |
|----|--------------|-----------------------|
| in | <i>value</i> | Floating-point value. |
|----|--------------|-----------------------|

Postcondition

A floating point value is written to the serial port.

See also

[Debug_SendMsg\(\)](#)

Debug_Assert()

```
void Debug_Assert (
    bool condition )
```

Stops program if *condition* is `true`. Useful for bug detection during debugging.

Precondition

Initialize the Debug module.

Parameters

| | | |
|----|------------------|------------------------------------|
| in | <i>condition</i> | Conditional statement to evaluate. |
|----|------------------|------------------------------------|

Postcondition

If `condition == true`, the program continues normally. If `condition == false`, a message is sent and a breakpoint is activated.

4.3.4 LCD

Collaboration diagram for LCD:

Files

- file [LCD.c](#)
Source code for LCD module.
- file [LCD.h](#)
Module for outputting the ECG waveform and HR to a liquid crystal display (LCD).

Enumerations

- enum { **X_MAX** = NUM_ROWS , **Y_MAX** = NUM_COLS }

Functions

- static void **LCD_updateNumPixels** (void)
Updates lcd's numPixels parameter after changing rows/columns.
- static void **LCD_setDim** (uint16_t d1, uint16_t d2, bool is_x, bool update_num_pixels)
Set new x or y parameters, and optionally update numPixels.
- static void **LCD_drawLine** (uint16_t center, uint16_t lineWidth, bool is_horizontal)
Helper function for drawing straight lines.

Variables

- struct {
 uint16_t **x1**
 starting x-value in range [0, x2]
 uint16_t **x2**
 ending x-value in range [0, NUM_ROWS)
 uint16_t **y1**
 starting y-value in range [0, y2]
 uint16_t **y2**
 ending x-value in range [0, NUM_COLS)
 uint32_t **numPixels**
 *num. of pixels to write; = (x2-x1 1) * (y2-y1+1)*
 uint8_t **R_val**
 5 or 6-bit R value
 uint8_t **G_val**
 6-bit G value
 uint8_t **B_val**
 5 or 6-bit B value
 bool **isOutputOn**
 if true, LCD driver writes from its memory to display
 bool **isInverted**
 if true, the display's colors are inverted
 bool **using16bitColors**
 true for 16-bit color depth, false for 18-bit
 bool **isInit**
 if true, LCD has been initialized
 } **lcd**

Color Setting Functions

- enum {
LCD_BLACK = 0x00 , **LCD_RED** = 0x04 , **LCD_GREEN** = 0x02 , **LCD_BLUE** = 0x01 ,
LCD_YELLOW = 0x06 , **LCD_CYAN** = 0x03 , **LCD_PURPLE** = 0x05 , **LCD_WHITE** = 0x07 ,
LCD_BLACK_INV = LCD_WHITE , **LCD_RED_INV** = LCD_CYAN , **LCD_GREEN_INV** = LCD_PURPLE ,
LCD_BLUE_INV = LCD_YELLOW ,
LCD_YELLOW_INV = LCD_BLUE , **LCD_CYAN_INV** = LCD_RED , **LCD_PURPLE_INV** = LCD_GREEN ,
LCD_WHITE_INV = LCD_BLACK }
- void **LCD_setColor** (uint8_t **R_val**, uint8_t **G_val**, uint8_t **B_val**)
Set the current color value for the display. Only the first 5-6 bits of each inputted value are used.
- void **LCD_setColor_3bit** (uint8_t color_code)
Set the color value via a 3-bit code.

Init./Config. Functions

- void **LCD_Init** (void)
Initialize the LCD driver and its internal independencies.
- void **LCD_setOutputMode** (bool isOn)
Toggle display output ON or OFF (OFF by default). Turning output OFF stops the LCD driver chip from writing to the display, and also blanks out the display completely.
- void **LCD_toggleOutput** (void)
Toggle display output ON or OFF (OFF by default).
- void **LCD_setColorInversionMode** (bool isOn)
Turn color inversion ON or OFF (OFF by default).
- void **LCD_toggleColorInversion** (void)
Toggle color inversion ON or OFF (OFF by default).
- void **LCD_setColorDepth** (bool is_16bit)
Set the color depth to 16-bit or 18-bit. 16-bit color depth allows for only ~65K colors, but only needs 2 data transfers. 18-bit color depth allows for ~262K colors, but requires 3 transfers.
- void **LCD_toggleColorDepth** (void)
Toggle 16-bit or 18-bit color depth (16-bit by default).

Drawing Area Definition Functions

- void **LCD_setArea** (uint16_t x1_new, uint16_t x2_new, uint16_t y1_new, uint16_t y2_new)
Set the area of the display to be written to. $0 \leq x1 \leq x2 < X_MAX$ $0 \leq y1 \leq y2 < Y_MAX$
- void **LCD_setX** (uint16_t x1_new, uint16_t x2_new)
Set only new x-coordinates to be written to. $0 \leq x1 \leq x2 < X_MAX$
- void **LCD_setY** (uint16_t y1_new, uint16_t y2_new)
Set only new y-coordinates to be written to. $0 \leq y1 \leq y2 < Y_MAX$

Drawing Functions

- void **LCD_Draw** (void)
*Draw on the LCD display. Call this function after setting the drawable area via **LCD_setArea()**, or after individually calling **LCD_setX()** and/or **LCD_setY()**.*
- void **LCD_Fill** (void)
Fill the display with a single color.
- void **LCD_drawHoriLine** (uint16_t yCenter, uint16_t lineWidth)
Draw a horizontal line across the entire display.

- void `LCD_drawVertLine` (uint16_t xCenter, uint16_t lineWidth)
Draw a vertical line across the entire display.
- void `LCD_drawRectangle` (uint16_t x1, uint16_t dx, uint16_t y1, uint16_t dy, bool isFilled)
Draw a rectangle of size $dx \times dy$ onto the display. The bottom-left corner will be located at $(x1, y1)$.
- void `LCD_graphSample` (uint16_t x1, uint16_t dx, uint16_t y1, uint16_t dy, uint16_t y_min, uint16_t y_max, uint16_t color_code)
Draw a rectangle of size $dx \times dy$ and blank out all other pixels between y_{min} and y_{max} .

4.3.4.1 Detailed Description

Module for displaying graphs on an LCD via the [IL9341](#) module.

4.3.4.2 Function Documentation

LCD_setDim()

```
static void LCD_setDim (
    uint16_t d1,
    uint16_t d2,
    bool is_x,
    bool update_num_pixels ) [inline], [static]
```

Set new x or y parameters, and optionally update numPixels.

Parameters

| | |
|--------------------------|--|
| <i>d1</i> | start index of selected dimension |
| <i>d2</i> | end index of selected dimension |
| <i>is_x</i> | true if dimension is x, false if y |
| <i>update_num_pixels</i> | true to update lcd.numPixels, false if not |

LCD_drawLine()

```
static void LCD_drawLine (
    uint16_t center,
    uint16_t lineWidth,
    bool is_horizontal ) [inline], [static]
```

Helper function for drawing straight lines.

Parameters

| | |
|------------------|--|
| <i>center</i> | Row or column that the line is centered on. <i>center</i> is increased or decreased if the line to be written would have gone out of bounds. |
| <i>lineWidth</i> | Width of the line. Should be a positive, odd number. |
| <i>is_row</i> | true for horizontal line, false for vertical line |

LCD_setOutputMode()

```
void LCD_setOutputMode (
    bool isOn )
```

Toggle display output ON or OFF (OFF by default). Turning output OFF stops the LCD driver chip from writing to the display, and also blanks out the display completely.

Parameters

| | | |
|----|-------------|---|
| in | <i>isOn</i> | true to turn display output ON, false to turn OFF |
|----|-------------|---|

See also

[LCD_toggleOutput\(\)](#)

LCD_toggleOutput()

```
void LCD_toggleOutput (
    void )
```

Toggle display output ON or OFF (OFF by default).

See also

[LCD_setOutputMode\(\)](#)

LCD_setColorInversionMode()

```
void LCD_setColorInversionMode (
    bool isOn )
```

Turn color inversion ON or OFF (OFF by default).

Parameters

| | | |
|----|-------------|--|
| in | <i>isOn</i> | true to invert colors, false to use regular colors |
|----|-------------|--|

See also

[LCD_toggleColorInversion\(\)](#), [LCD_setColor\(\)](#), [LCD_setColor_3bit\(\)](#)

LCD_toggleColorInversion()

```
void LCD_toggleColorInversion (
    void )
```

Toggle color inversion ON or OFF (OFF by default).

See also

[LCD_setColorInversionMode\(\)](#), [LCD_setColor\(\)](#), [LCD_setColor_3bit\(\)](#)

LCD_setColorDepth()

```
void LCD_setColorDepth (
    bool is_16bit )
```

Set the color depth to 16-bit or 18-bit. 16-bit color depth allows for only ~65K colors, but only needs 2 data transfers. 18-bit color depth allows for ~262K colors, but requires 3 transfers.

Parameters

| | | |
|----|-----------------|------------------------------------|
| in | <i>is_16bit</i> | true for 16-bit, false for 18b-bit |
|----|-----------------|------------------------------------|

See also

[LCD_toggleColorDepth\(\)](#), [LCD_setColor\(\)](#), [LCD_setColor_3bit\(\)](#)

LCD_toggleColorDepth()

```
void LCD_toggleColorDepth (
    void )
```

Toggle 16-bit or 18-bit color depth (16-bit by default).

See also

[LCD_setColorDepth\(\)](#), [LCD_setColor\(\)](#), [LCD_setColor_3bit\(\)](#)

LCD_setArea()

```
void LCD_setArea (
    uint16_t x1_new,
    uint16_t x2_new,
    uint16_t y1_new,
    uint16_t y2_new )
```

Set the area of the display to be written to. $0 \leq x1 \leq x2 < X_MAX$ $0 \leq y1 \leq y2 < Y_MAX$

Parameters

| | |
|---------------|-------------------------|
| <i>x1_new</i> | left-most x-coordinate |
| <i>x2_new</i> | right-most x-coordinate |
| <i>y1_new</i> | lowest y-coordinate |
| <i>y2_new</i> | highest y-coordinate |

See also

[LCD_setX\(\)](#), [LCD_setY\(\)](#)

LCD_setX()

```
void LCD_setX (
    uint16_t x1_new,
    uint16_t x2_new )
```

Set only new x-coordinates to be written to. $0 \leq x1 \leq x2 < X_MAX$

Parameters

| | |
|---------------|-------------------------|
| <i>x1_new</i> | left-most x-coordinate |
| <i>x2_new</i> | right-most x-coordinate |

See also

[LCD_setY\(\)](#), [LCD_setArea\(\)](#)

LCD_setY()

```
void LCD_setY (
    uint16_t y1_new,
    uint16_t y2_new )
```

Set only new y-coordinates to be written to. $0 \leq y1 \leq y2 < Y_MAX$

Parameters

| | |
|---------------|----------------------|
| <i>y1_new</i> | lowest y-coordinate |
| <i>y2_new</i> | highest y-coordinate |

See also

[LCD_setX\(\)](#), [LCD_setArea\(\)](#)

LCD_setColor()

```
void LCD_setColor (
    uint8_t R_val,
    uint8_t G_val,
    uint8_t B_val )
```

Set the current color value for the display. Only the first 5-6 bits of each inputted value are used.

Parameters

| | |
|--------------|---|
| <i>R_val</i> | 5-bit ([0-31]) R value; 6-bit ([0-63]) if color depth is 18-bit |
| <i>G_val</i> | 6-bit ([0-63]) G value |
| <i>B_val</i> | 5-bit ([0-31]) B value; 6-bit ([0-63]) if color depth is 18-bit |

See also

[LCD_setColorDepth\(\)](#), [LCD_toggleColorDepth\(\)](#), [LCD_setColor_3bit\(\)](#)

LCD_setColor_3bit()

```
void LCD_setColor_3bit (
    uint8_t color_code )
```

Set the color value via a 3-bit code.

Parameters

| | |
|-------------------|--|
| <i>color_code</i> | 3-bit color value to use. Bits 2, 1, 0 correspond to R, G, and B values, respectively. |
|-------------------|--|

See also

[LCD_setColorDepth\(\)](#), [LCD_toggleColorDepth\(\)](#), [LCD_setColor\(\)](#)

This is simply a convenience function for setting the color using the enum values defined in the header file. The ones with the `__INV` suffix should be used when the display colors are inverted.

| hex | binary | macro |
|------|--------|------------|
| 0x00 | 000 | LCD_BLACK |
| 0x01 | 001 | LCD_BLUE |
| 0x02 | 010 | LCD_GREEN |
| 0x03 | 011 | LCD_CYAN |
| 0x04 | 100 | LCD_RED |
| 0x05 | 101 | LCD_PURPLE |
| 0x06 | 110 | LCD_YELLOW |
| 0x07 | 111 | LCD_WHITE |

LCD_Draw()

```
void LCD_Draw (
    void )
```

Draw on the LCD display. Call this function after setting the drawable area via [LCD_setArea\(\)](#), or after individually calling [LCD_setX\(\)](#) and/or [LCD_setY\(\)](#).

LCD_drawHoriLine()

```
void LCD_drawHoriLine (
    uint16_t yCenter,
    uint16_t lineWidth )
```

Draw a horizontal line across the entire display.

Parameters

| | |
|------------------|---|
| <i>yCenter</i> | y-coordinate to center the line on |
| <i>lineWidth</i> | width of the line; should be a positive, odd number |

@seeLCD_drawVertLine, [LCD_drawRectangle\(\)](#)

LCD_drawVertLine()

```
void LCD_drawVertLine (
    uint16_t xCenter,
    uint16_t lineWidth )
```

Draw a vertical line across the entire display.

Parameters

| | |
|------------------|---|
| <i>xCenter</i> | x-coordinate to center the line on |
| <i>lineWidth</i> | width of the line; should be a positive, odd number |

@seeLCD_drawHoriLine, [LCD_drawRectangle\(\)](#)

LCD_drawRectangle()

```
void LCD_drawRectangle (
    uint16_t x1,
    uint16_t dx,
    uint16_t y1,
    uint16_t dy,
    bool isFilled )
```

Draw a rectangle of size *dx* x *dy* onto the display. The bottom-left corner will be located at (*x1*, *y1*).

Parameters

| | |
|-----------------|--|
| <i>x1</i> | lowest (left-most) x-coordinate |
| <i>dx</i> | length (horizontal distance) of the rectangle |
| <i>y1</i> | lowest (bottom-most) y-coordinate |
| <i>dy</i> | height (vertical distance) of the rectangle |
| <i>isFilled</i> | <code>true</code> to fill the rectangle, <code>false</code> to leave it unfilled |

LCD_graphSample()

```
void LCD_graphSample (
    uint16_t x1,
    uint16_t dx,
    uint16_t y1,
    uint16_t dy,
    uint16_t y_min,
    uint16_t y_max,
    uint16_t color_code )
```

Draw a rectangle of size $dx \times dy$ and blank out all other pixels between y_{min} and y_{max} .

Parameters

| | |
|-------------------|--|
| <i>x1</i> | lowest (left-most) x-coordinate |
| <i>dx</i> | length (horizontal distance) of the column |
| <i>y1</i> | y-coordinate of the pixel's bottom side |
| <i>dy</i> | height (vertical distance) of the pixel |
| <i>y_min</i> | lowest (bottom-most) y-coordinate |
| <i>y_max</i> | highest (top-most) y-coordinate |
| <i>color_code</i> | 3-bit color code |

`NUM_COEFF_MOVAVG = 30 , STATE_BUFF_SIZE_MOVAVG = NUM_COEFF_MOVAVG + QRS_NUM_↵`
`SAMP - 1 }`

Functions

- `static uint8_t QRS_findFiducialMarks (float32_t yn[], uint16_t fidMarkArray[])`
Mark local peaks in the input signal y as potential candidates for QRS complexes (AKA "fiducial marks").
- `static void QRS_initLevels (float32_t yn[])`
Initialize the signal and noise levels for the QRS detector using the initial block of input signal data.
- `static float32_t QRS_updateLevel (float32_t peakAmplitude, float32_t level)`
Update signal or noise level based on a confirmed peak's amplitude.
- `static float32_t QRS_UpdateThreshold (void)`
Update the amplitude threshold used to identify peaks based on the signal and noise levels.
- `void QRS_Init (void)`
Initialize the QRS detector.
- `void QRS_Preprocess (const float32_t xn[], float32_t yn[])`
Preprocess the ECG data to remove noise and/or exaggerate the signal characteristic(s) of interest.
- `float32_t QRS_applyDecisionRules (const float32_t yn[])`
Calculate the average heart rate (HR) using predetermined decision rules.
- `float32_t QRS_runDetection (const float32_t xn[], float32_t yn[])`
Run the full algorithm (preprocessing and decision rules) on the inputted ECG data.

4.3.5.1 Detailed Description

Module for analyzing ECG data to determine heart rate.

4.3.5.2 Function Documentation

QRS_findFiducialMarks()

```
static uint8_t QRS_findFiducialMarks (
    float32_t yn[],
    uint16_t fidMarkArray[] ) [static]
```

Mark local peaks in the input signal y as potential candidates for QRS complexes (AKA "fiducial marks").

Parameters

| | | |
|-----|---------------------|---|
| in | <i>yn</i> | Array containing the preprocessed ECG signal $y[n]$ |
| in | <i>fidMarkArray</i> | Array to place the fiducial mark's sample indices into. |
| out | <i>uint8_t</i> | Number of identified fiducial marks |

The fiducial marks must be spaced apart by at least 200 [ms] (40 samples @ fs = 200 [Hz]). If a peak is found within this range, the one with the largest amplitude is taken to be the correct peak and the other is ignored.

QRS_initLevels()

```
static void QRS_initLevels (
    float32_t yn[] ) [static]
```

Initialize the signal and noise levels for the QRS detector using the initial block of input signal data.

Parameters

| | | |
|----|-----------|---|
| in | <i>yn</i> | Array containing the preprocessed ECG signal $y[n]$ |
|----|-----------|---|

Postcondition

The detector's signal and noise levels are initialized.

QRS_updateLevel()

```
static float32_t QRS_updateLevel (
    float32_t peakAmplitude,
    float32_t level ) [static]
```

Update signal or noise level based on a confirmed peak's amplitude.

Parameters

| | | |
|-----|----------------------|--|
| in | <i>peakAmplitude</i> | Amplitude of the peak in signal $y[n]$ |
| in | <i>level</i> | The current value of the signal level or noise level |
| out | <i>newLevel</i> | The updated value of the signal level or noise level |

QRS_UpdateThreshold()

```
static float32_t QRS_UpdateThreshold (
    void ) [static]
```

Update the amplitude threshold used to identify peaks based on the signal and noise levels.

Parameters

| | | |
|-----|------------------|---|
| out | <i>threshold</i> | New threshold to use for next comparison. |
|-----|------------------|---|

$$threshold = f(signalLevel, noiseLevel) = noiseLevel + 0.25(signalLevel - noiseLevel)$$

QRS_Preprocess()

```
void QRS_Preprocess (
    const float32_t xn[],
    float32_t yn[] )
```

Preprocess the ECG data to remove noise and/or exaggerate the signal characteristic(s) of interest.

Precondition

Fill `inputBuffer` with raw or lightly preprocessed ECG data.

Parameters

| | | |
|----|-----------|--|
| in | <i>xn</i> | Array of raw ECG signal values. |
| in | <i>yn</i> | Array used to hold preprocessed ECG signal values. |

Postcondition

`yn` will contain the preprocessed data, which is ready to be analyzed to calculate HR.

See also

[QRS_applyDecisionRules\(\)](#)

This function uses the same overall preprocessing pipeline as the original Pan-Tompkins algorithm, but the high-pass and low-pass filters have been replaced with ones generated using Scipy.

QRS_applyDecisionRules()

```
float32_t QRS_applyDecisionRules (
    const float32_t yn[] )
```

Calculate the average heart rate (HR) using predetermined decision rules.

Precondition

Preprocess the raw ECG data.

Parameters

| | | |
|-----|------------------|--|
| in | <i>yn</i> | Array of preprocessed ECG signal values. |
| out | <i>heartRate</i> | Average heart rate in [bpm]. |

Postcondition

Certain information (signal/noise levels, thresholds, etc.) is retained between calls.

See also

[QRS_Preprocess\(\)](#)

QRS_runDetection()

```
float32_t QRS_runDetection (
    const float32_t xn[],
    float32_t yn[] )
```

Run the full algorithm (preprocessing and decision rules) on the inputted ECG data.

This function simply combines the preprocessing and decision rules functions into a single function.

Parameters

| | | |
|-----|------------------|--|
| in | <i>xn</i> | Array of raw ECG signal values. |
| in | <i>yn</i> | Array used to hold preprocessed ECG signal values. |
| out | <i>heartRate</i> | Average heart rate in [bpm]. |

Postcondition

yn will contain the preprocessed data.

Certain information (signal/noise levels, thresholds, etc.) is retained between calls.

    0.03333333507180214f, 0.03333333507180214f
}
```

4.4 Common

Collaboration diagram for Common:

**Modules**

- [FIFO](#)
- [NewAssert](#)

Files

- file [NewAssert.c](#)
Source code for custom assert implementation.
- file [NewAssert.h](#)
Header file for custom assert implementation.

Functions

- void [Assert](#) (bool condition)
Custom assert implementation that is more lightweight than the one from newlib.

4.4.1 Detailed Description

Modules that are used by multiple layers and/or don't fit into any one layer.

4.4.2 Function Documentation

Assert()

```
void Assert (
    bool condition )
```

Custom `assert` implementation that is more lightweight than the one from `newlib`.

Parameters

| | | |
|-----------------|------------------------|--|
| <code>in</code> | <code>condition</code> | Conditional to test. Causes an infinite loop if <code>false</code> . |
|-----------------|------------------------|--|

4.4.3 FIFO

Collaboration diagram for FIFO:

Files

- file [FIFO.c](#)
Source code for FIFO buffer module.
- file [FIFO.h](#)
FIFO buffer data structure.

Data Structures

- struct [FIFO_t](#)

Macros

- `#define FIFO_POOL_SIZE 5`

Functions

- [FIFO_t](#) * [FIFO_Init](#) (volatile uint32_t buffer[], const uint32_t N)
Initialize a FIFO buffer of length N.

Variables

- static `FIFO_t buffer_pool` [`FIFO_POOL_SIZE`] = { 0 }
pre-allocated buffer pool
- static `uint8_t free_buffers` = `FIFO_POOL_SIZE`
no. of remaining buffers

Basic Operations

- void `FIFO_Put` (volatile `FIFO_t` *fifo, const `uint32_t` val)
Add a value to the end of the buffer.
- `uint32_t FIFO_Get` (volatile `FIFO_t` *fifo)
Remove the first value of the buffer.
- void `FIFO_TransferOne` (volatile `FIFO_t` *srcFifo, volatile `FIFO_t` *destFifo)
Transfer a value from one FIFO buffer to another.

Bulk Removal

- void `FIFO_Flush` (volatile `FIFO_t` *fifo, `uint32_t` outputBuffer[])
Empty the FIFO buffer's contents into an array.
- void `FIFO_Reset` (volatile `FIFO_t` *fifo)
Reset the FIFO buffer.
- void `FIFO_TransferAll` (volatile `FIFO_t` *srcFifo, volatile `FIFO_t` *destFifo)
Transfer the contents of one FIFO buffer to another.

Peeking

- `uint32_t FIFO_PeekOne` (volatile `FIFO_t` *fifo)
See the first element in the FIFO without removing it.
- void `FIFO_PeekAll` (volatile `FIFO_t` *fifo, `uint32_t` outputBuffer[])
See the FIFO buffer's contents without removing them.

Status Checks

- bool `FIFO_isFull` (volatile `FIFO_t` *fifo)
Check if the FIFO buffer is full.
- bool `FIFO_isEmpty` (volatile `FIFO_t` *fifo)
Check if the FIFO buffer is empty.
- `uint32_t FIFO_getCurrSize` (volatile `FIFO_t` *fifo)
Get the current size of the FIFO buffer.

4.4.3.1 Detailed Description

Module for using the "first-in first-out (FIFO) buffer" data structure.

4.4.3.2 Function Documentation

FIFO_Init()

```
FIFO_t * FIFO_Init (
    volatile uint32_t buffer[],
    const uint32_t N )
```

Initialize a FIFO buffer of length N.

Parameters

| | |
|---------------|--|
| <i>buffer</i> | Array of size N to be used as FIFO buffer |
| <i>N</i> | Length of <i>buffer</i> . Usable length is $N - 1$. |

Returns

pointer to the FIFO buffer

TODO: Add details

FIFO_Put()

```
void FIFO_Put (
    volatile FIFO_t * fifo,
    const uint32_t val )
```

Add a value to the end of the buffer.

Parameters

| | |
|-------------|--------------------------|
| <i>fifo</i> | Pointer to FIFO object |
| <i>val</i> | last value in the buffer |

FIFO_Get()

```
uint32_t FIFO_Get (
    volatile FIFO_t * fifo )
```

Remove the first value of the buffer.

Parameters

| | |
|-------------|------------------------|
| <i>fifo</i> | Pointer to FIFO object |
|-------------|------------------------|

Returns

First sample in the FIFO.

FIFO_TransferOne()

```
void FIFO_TransferOne (
    volatile FIFO_t * srcFifo,
    volatile FIFO_t * destFifo )
```

Transfer a value from one FIFO buffer to another.

Parameters

| | |
|-----------------|-------------------------------------|
| <i>srcFifo</i> | Pointer to source FIFO buffer. |
| <i>destFifo</i> | Pointer to destination FIFO buffer. |

FIFO_Flush()

```
void FIFO_Flush (
    volatile FIFO_t * fifo,
    uint32_t outputBuffer[] )
```

Empty the FIFO buffer's contents into an array.

Parameters

| | |
|---------------------|--|
| <i>fifo</i> | Pointer to source FIFO buffer. |
| <i>outputBuffer</i> | Array to output values to. Should be the same length as the FIFO buffer. |

FIFO_Reset()

```
void FIFO_Reset (
    volatile FIFO_t * fifo )
```

Reset the FIFO buffer.

Parameters

| | | |
|-----------|-------------|-------------------------|
| <i>in</i> | <i>fifo</i> | Pointer to FIFO buffer. |
|-----------|-------------|-------------------------|

FIFO_TransferAll()

```
void FIFO_TransferAll (
    volatile FIFO_t * srcFifo,
    volatile FIFO_t * destFifo )
```

Transfer the contents of one FIFO buffer to another.

Parameters

| | |
|-----------------|-------------------------------------|
| <i>srcFifo</i> | Pointer to source FIFO buffer. |
| <i>destFifo</i> | Pointer to destination FIFO buffer. |

FIFO_PeekOne()

```
uint32_t FIFO_PeekOne (
    volatile FIFO_t * fifo )
```

See the first element in the FIFO without removing it.

Parameters

| | |
|-------------|------------------------|
| <i>fifo</i> | Pointer to FIFO object |
|-------------|------------------------|

Returns

First sample in the FIFO.

FIFO_PeekAll()

```
void FIFO_PeekAll (
    volatile FIFO_t * fifo,
    uint32_t outputBuffer[] )
```

See the FIFO buffer's contents without removing them.

Parameters

| | |
|---------------------|--|
| <i>fifo</i> | Pointer to FIFO object |
| <i>outputBuffer</i> | Array to output values to. Should be the same length as the FIFO buffer. |

FIFO_isFull()

```
bool FIFO_isFull (
    volatile FIFO_t * fifo )
```

Check if the FIFO buffer is full.

Parameters

| | |
|-------------|-----------------------------|
| <i>fifo</i> | Pointer to the FIFO buffer. |
|-------------|-----------------------------|

Return values

| | |
|--------------|-------------------------|
| <i>true</i> | The buffer is full. |
| <i>false</i> | The buffer is not full. |

FIFO_isEmpty()

```
bool FIFO_isEmpty (
    volatile FIFO_t * fifo )
```

Check if the FIFO buffer is empty.

Parameters

| | |
|-------------|-----------------------------|
| <i>fifo</i> | Pointer to the FIFO buffer. |
|-------------|-----------------------------|

Return values

| | |
|--------------|--------------------------|
| <i>true</i> | The buffer is empty. |
| <i>false</i> | The buffer is not empty. |

FIFO_getCurrSize()

```
uint32_t FIFO_getCurrSize (
    volatile FIFO_t * fifo )
```

Get the current size of the FIFO buffer.

Parameters

| | |
|-------------|-----------------------------|
| <i>fifo</i> | Pointer to the FIFO buffer. |
|-------------|-----------------------------|

4.4.4 NewAssert

Collaboration diagram for NewAssert:

Module for using a custom `assert` implementation.

5 Data Structure Documentation

5.1 FIFO_t Struct Reference

Data Fields

- volatile uint32_t * **buffer**
(pointer to) array to use as FIFO buffer
- volatile uint32_t **N**
length of buffer

- volatile uint32_t **front_idx**
idx of front of FIFO
- volatile uint32_t **back_idx**
idx of back of FIFO

The documentation for this struct was generated from the following file:

- [FIFO.c](#)

5.2 GPIO_Port_t Struct Reference

Data Fields

- const uint32_t **BASE_ADDRESS**
- const uint32_t **DATA_REGISTER**
- bool **isInit**

The documentation for this struct was generated from the following file:

- [GPIO.c](#)

5.3 Led_t Struct Reference

Data Fields

- [GPIO_Port_t](#) * **GPIO_PORT_PTR**
pointer to GPIO port data structure
- GPIO_Pin_t **GPIO_PIN**
GPIO pin number.
- bool **is_ON**
state indicator

The documentation for this struct was generated from the following file:

- [Led.c](#)

5.4 Timer_t Struct Reference

Data Fields

- const timerName_t **NAME**
- const uint32_t **BASE_ADDR**
- register_t **controlRegister**
- register_t **intervalLoadRegister**
- register_t **interruptClearRegister**
- bool **isInit**

The documentation for this struct was generated from the following file:

- [Timer.c](#)

5.5 UART_t Struct Reference

Data Fields

- const uint32_t **BASE_ADDRESS**
- register_t const **FLAG_R_ADDRESS**
- [GPIO_Port_t](#) * **GPIO_PORT**
pointer to GPIO port data structure
- GPIO_Pin_t **RX_PIN_NUM**
GPIO pin number.
- GPIO_Pin_t **TX_PIN_NUM**
GPIO pin number.
- bool **isInit**

The documentation for this struct was generated from the following file:

- [UART.c](#)

6 File Documentation

6.1 DAQ.c File Reference

Source code for DAQ module.

```
#include "DAQ.h"
#include "lookup.h"
#include "ADC.h"
#include "Timer.h"
#include "NewAssert.h"
#include "arm_math_types.h"
#include "dsp/filtering_functions.h"
#include "tm4c123gh6pm.h"
#include <math.h>
#include <stdbool.h>
#include <stdint.h>
```

Macros

- #define **SAMPLING_PERIOD_MS** 5
sampling period in ms ($T_s = 1/f_s$)

Typedefs

- typedef arm_biquad_casd_df1_inst_f32 **Filter_t**

Enumerations

- enum {
NUM_STAGES_NOTCH = 6 , **NUM_COEFFS_NOTCH** = NUM_STAGES_NOTCH * 5 , **STATE_BUFF_SIZE_NOTCH** = NUM_STAGES_NOTCH * 4 , **NUM_STAGES_BANDPASS** = 4 ,
NUM_COEFFS_DAQ_BANDPASS = NUM_STAGES_BANDPASS * 5 , **STATE_BUFF_SIZE_BANDPASS** = NUM_STAGES_BANDPASS * 4 }

Functions

Initialization

- void [DAQ_Init](#) (void)
Initialize the data acquisition (DAQ) module.

Reading Input Data

- uint16_t [DAQ_readSample](#) (void)
Read a sample from the ADC.
- float32_t [DAQ_convertToMilliVolts](#) (uint16_t sample)
Convert a 12-bit ADC sample to a floating-point voltage value via LUT.

Digital Filtering Functions

- float32_t [DAQ_NotchFilter](#) (volatile float32_t xn)
Apply a 60 [Hz] notch filter to an input sample.
- float32_t [DAQ_BandpassFilter](#) (volatile float32_t xn)
Apply a 0.5-40 [Hz] bandpass filter to an input sample.

Variables

- static const float32_t * **DAQ_LOOKUP_TABLE** = 0
- static const float32_t [COEFFS_NOTCH](#) [NUM_COEFFS_NOTCH]
- static const float32_t [COEFFS_BANDPASS](#) [NUM_COEFFS_DAQ_BANDPASS]
- static float32_t **stateBuffer_Notch** [STATE_BUFF_SIZE_NOTCH]
- static const Filter_t **notchFiltStruct** = { NUM_STAGES_NOTCH, stateBuffer_Notch, COEFFS_NOTCH }
- static const Filter_t *const **notchFilter** = ¬chFiltStruct
- static float32_t **stateBuffer_Bandpass** [STATE_BUFF_SIZE_BANDPASS]
- static const Filter_t [bandpassFiltStruct](#)
- static const Filter_t *const **bandpassFilter** = &bandpassFiltStruct

6.1.1 Detailed Description

Source code for DAQ module.

Author

Bryan McElvy

6.2 DAQ.h File Reference

Application software for handling data acquisition (DAQ) functions.

```
#include "lookup.h"
#include "ADC.h"
#include "Timer.h"
#include "NewAssert.h"
#include "arm_math_types.h"
#include "dsp/filtering_functions.h"
#include "tm4c123gh6pm.h"
#include <math.h>
#include <stdbool.h>
#include <stdint.h>
```

Functions

Initialization

- void [DAQ_Init](#) (void)
Initialize the data acquisition (DAQ) module.

Reading Input Data

- uint16_t [DAQ_readSample](#) (void)
Read a sample from the ADC.
- float32_t [DAQ_convertToMilliVolts](#) (uint16_t sample)
Convert a 12-bit ADC sample to a floating-point voltage value via LUT.

Digital Filtering Functions

- float32_t [DAQ_NotchFilter](#) (volatile float32_t xn)
Apply a 60 [Hz] notch filter to an input sample.
- float32_t [DAQ_BandpassFilter](#) (volatile float32_t xn)
Apply a 0.5-40 [Hz] bandpass filter to an input sample.

6.2.1 Detailed Description

Application software for handling data acquisition (DAQ) functions.

Author

Bryan McElvy

6.3 Debug.h File Reference

Functions to output debugging information to a serial port via UART.

```
#include "UART.h"
#include "NewAssert.h"
#include "tm4c123gh6pm.h"
#include <stdbool.h>
#include <stdint.h>
```

Functions

Initialization

- void `Debug_Init` (void)
Initialize the Debug module.

Assertions

- void `Debug_Assert` (bool condition)
Stops program if `condition` is `true`. Useful for bug detection during debugging.

Serial Output

- enum `Msg_t` { `DEBUG_DAQ_INIT` , `DEBUG_QRS_INIT` , `DEBUG_LCD_INIT` , `DEBUG_QRS_START` }
- void `Debug_SendMsg` (void *message)
Send a message to the serial port.
- void `Debug_SendFromList` (Msg_t msg)
Send a message from the message list.
- void `Debug_WriteFloat` (double value)
Write a floating-point value to the serial port.

6.3.1 Detailed Description

Functions to output debugging information to a serial port via UART.

Author

Bryan McElvy

6.4 LCD.c File Reference

Source code for LCD module.

```
#include "LCD.h"
#include "ILI9341.h"
#include "SPI.h"
#include "Timer.h"
#include "NewAssert.h"
#include "tm4c123gh6pm.h"
#include <stdbool.h>
#include <stdint.h>
```

Functions

- static void **LCD_updateNumPixels** (void)
Updates lcd's numPixels parameter after changing rows/columns.
- static void **LCD_setDim** (uint16_t d1, uint16_t d2, bool is_x, bool update_num_pixels)
Set new x or y parameters, and optionally update numPixels.
- static void **LCD_drawLine** (uint16_t center, uint16_t lineWidth, bool is_horizontal)
Helper function for drawing straight lines.

Init./Config. Functions

- void **LCD_Init** (void)
Initialize the LCD driver and its internal independencies.
- void **LCD_setOutputMode** (bool isOn)
Toggle display output ON or OFF (OFF by default). Turning output OFF stops the LCD driver chip from writing to the display, and also blanks out the display completely.
- void **LCD_toggleOutput** (void)
Toggle display output ON or OFF (OFF by default).
- void **LCD_setColorInversionMode** (bool isOn)
Turn color inversion ON or OFF (OFF by default).
- void **LCD_toggleColorInversion** (void)
Toggle color inversion ON or OFF (OFF by default).
- void **LCD_setColorDepth** (bool is_16bit)
Set the color depth to 16-bit or 18-bit. 16-bit color depth allows for only ~65K colors, but only needs 2 data transfers. 18-bit color depth allows for ~262K colors, but requires 3 transfers.
- void **LCD_toggleColorDepth** (void)
Toggle 16-bit or 18-bit color depth (16-bit by default).

Drawing Area Definition Functions

- void **LCD_setArea** (uint16_t x1_new, uint16_t x2_new, uint16_t y1_new, uint16_t y2_new)
Set the area of the display to be written to. $0 \leq x1 \leq x2 < X_MAX$ $0 \leq y1 \leq y2 < Y_MAX$
- void **LCD_setX** (uint16_t x1_new, uint16_t x2_new)
Set only new x-coordinates to be written to. $0 \leq x1 \leq x2 < X_MAX$
- void **LCD_setY** (uint16_t y1_new, uint16_t y2_new)
Set only new y-coordinates to be written to. $0 \leq y1 \leq y2 < Y_MAX$

Color Setting Functions

- void **LCD_setColor** (uint8_t R_val, uint8_t G_val, uint8_t B_val)
Set the current color value for the display. Only the first 5-6 bits of each inputted value are used.
- void **LCD_setColor_3bit** (uint8_t color_code)
Set the color value via a 3-bit code.

Drawing Functions

- void **LCD_Draw** (void)
*Draw on the LCD display. Call this function after setting the drawable area via **LCD_setArea()**, or after individually calling **LCD_setX()** and/or **LCD_setY()**.*
- void **LCD_Fill** (void)
Fill the display with a single color.
- void **LCD_drawHoriLine** (uint16_t yCenter, uint16_t lineWidth)
Draw a horizontal line across the entire display.
- void **LCD_drawVertLine** (uint16_t xCenter, uint16_t lineWidth)
Draw a vertical line across the entire display.
- void **LCD_drawRectangle** (uint16_t x1, uint16_t dx, uint16_t y1, uint16_t dy, bool isFilled)
Draw a rectangle of size dx x dy onto the display. The bottom-left corner will be located at (x1, y1).
- void **LCD_graphSample** (uint16_t x1, uint16_t dx, uint16_t y1, uint16_t dy, uint16_t y_min, uint16_t y_max, uint16_t color_code)
Draw a rectangle of size dx x dy and blank out all other pixels between y_min and y_max.

Variables

- struct {
 - uint16_t **x1**
starting x-value in range [0, x2]
 - uint16_t **x2**
ending x-value in range [0, NUM_ROWS)
 - uint16_t **y1**
starting y-value in range [0, y2]
 - uint16_t **y2**
ending x-value in range [0, NUM_COLS)
 - uint32_t **numPixels**
*num. of pixels to write; = (x2-x1 1) * (y2-y1+1)*
 - uint8_t **R_val**
5 or 6-bit R value
 - uint8_t **G_val**
6-bit G value
 - uint8_t **B_val**
5 or 6-bit B value
 - bool **isOutputOn**
if true, LCD driver writes from its memory to display
 - bool **isInverted**
if true, the display's colors are inverted
 - bool **using16bitColors**
true for 16-bit color depth, false for 18-bit
 - bool **isInit**
if true, LCD has been initialized
- } **lcd**

6.4.1 Detailed Description

Source code for LCD module.

Author

Bryan McElvy

6.5 LCD.h File Reference

Module for outputting the ECG waveform and HR to a liquid crystal display (LCD).

```
#include "ILI9341.h"
#include "SPI.h"
#include "Timer.h"
#include "NewAssert.h"
#include "tm4c123gh6pm.h"
#include <stdbool.h>
#include <stdint.h>
```

Enumerations

- enum { **X_MAX** = NUM_ROWS , **Y_MAX** = NUM_COLS }

Functions

Init./Config. Functions

- void **LCD_Init** (void)
Initialize the LCD driver and its internal independencies.
- void **LCD_setOutputMode** (bool isOn)
Toggle display output ON or OFF (OFF by default). Turning output OFF stops the LCD driver chip from writing to the display, and also blanks out the display completely.
- void **LCD_toggleOutput** (void)
Toggle display output ON or OFF (OFF by default).
- void **LCD_setColorInversionMode** (bool isOn)
Turn color inversion ON or OFF (OFF by default).
- void **LCD_toggleColorInversion** (void)
Toggle color inversion ON or OFF (OFF by default).
- void **LCD_setColorDepth** (bool is_16bit)
Set the color depth to 16-bit or 18-bit. 16-bit color depth allows for only ~65K colors, but only needs 2 data transfers. 18-bit color depth allows for ~262K colors, but requires 3 transfers.
- void **LCD_toggleColorDepth** (void)
Toggle 16-bit or 18-bit color depth (16-bit by default).

Drawing Area Definition Functions

- void **LCD_setArea** (uint16_t x1_new, uint16_t x2_new, uint16_t y1_new, uint16_t y2_new)
Set the area of the display to be written to. $0 \leq x1 \leq x2 < X_MAX$ $0 \leq y1 \leq y2 < Y_MAX$
- void **LCD_setX** (uint16_t x1_new, uint16_t x2_new)
Set only new x-coordinates to be written to. $0 \leq x1 \leq x2 < X_MAX$
- void **LCD_setY** (uint16_t y1_new, uint16_t y2_new)
Set only new y-coordinates to be written to. $0 \leq y1 \leq y2 < Y_MAX$

Drawing Functions

- void **LCD_Draw** (void)
*Draw on the LCD display. Call this function after setting the drawable area via **LCD_setArea()**, or after individually calling **LCD_setX()** and/or **LCD_setY()**.*
- void **LCD_Fill** (void)
Fill the display with a single color.
- void **LCD_drawHoriLine** (uint16_t yCenter, uint16_t lineWidth)
Draw a horizontal line across the entire display.
- void **LCD_drawVertLine** (uint16_t xCenter, uint16_t lineWidth)
Draw a vertical line across the entire display.
- void **LCD_drawRectangle** (uint16_t x1, uint16_t dx, uint16_t y1, uint16_t dy, bool isFilled)
Draw a rectangle of size $dx \times dy$ onto the display. The bottom-left corner will be located at $(x1, y1)$.
- void **LCD_graphSample** (uint16_t x1, uint16_t dx, uint16_t y1, uint16_t dy, uint16_t y_min, uint16_t y_max, uint16_t color_code)
Draw a rectangle of size $dx \times dy$ and blank out all other pixels between y_min and y_max .

Color Setting Functions

- enum {
 LCD_BLACK = 0x00 , **LCD_RED** = 0x04 , **LCD_GREEN** = 0x02 , **LCD_BLUE** = 0x01 ,
 LCD_YELLOW = 0x06 , **LCD_CYAN** = 0x03 , **LCD_PURPLE** = 0x05 , **LCD_WHITE** = 0x07 ,
 LCD_BLACK_INV = LCD_WHITE , **LCD_RED_INV** = LCD_CYAN , **LCD_GREEN_INV** = LCD_PURPLE ,
 LCD_BLUE_INV = LCD_YELLOW ,
 LCD_YELLOW_INV = LCD_BLUE , **LCD_CYAN_INV** = LCD_RED , **LCD_PURPLE_INV** = LCD_GREEN ,
 LCD_WHITE_INV = LCD_BLACK }
• void **LCD_setColor** (uint8_t R_val, uint8_t G_val, uint8_t B_val)
Set the current color value for the display. Only the first 5-6 bits of each inputted value are used.
- void **LCD_setColor_3bit** (uint8_t color_code)
Set the color value via a 3-bit code.

6.5.1 Detailed Description

Module for outputting the ECG waveform and HR to a liquid crystal display (LCD).

Author

Bryan McElvy

6.6 QRS.c File Reference

Source code for QRS module.

```
#include "QRS.h"
#include "arm_math_types.h"
#include "dsp/filtering_functions.h"
#include "dsp/statistics_functions.h"
#include <stdbool.h>
#include <stdint.h>
```

Macros

- **#define QRS_NUM_FID_MARKS** 13
- **#define FLOAT_COMPARE_TOLERANCE** (float32_t)(1E-5f)
- **#define IS_GREATER**(X, Y) (bool) ((X - Y) > FLOAT_COMPARE_TOLERANCE)
- **#define IS_LESSER**(X, Y) (bool) ((Y - X) > FLOAT_COMPARE_TOLERANCE)
- **#define IS_PEAK**(X_MINUS_1, X, X_PLUS_1) (bool) (IS_GREATER(X, X_MINUS_1) && IS_GREATER(X, X_PLUS_1))

Typedefs

- typedef arm_biquad_casd_df1_inst_f32 **IIR_Filt_t**
- typedef arm_fir_instance_f32 **FIR_Filt_t**

Enumerations

- enum {
 NUM_STAGES_HIGHPASS = 2 , **NUM_COEFF_HIGHPASS** = NUM_STAGES_HIGHPASS * 5 , **STATE_BUFF_SIZE_HIGHPASS** = NUM_STAGES_HIGHPASS * 4 , **NUM_STAGES_LOWPASS** = 2 ,

 NUM_COEFF_MOVAVG = 30 , **STATE_BUFF_SIZE_MOVAVG** = NUM_COEFF_MOVAVG + QRS_NUM_SAMP - 1 }
}

Functions

- static uint8_t **QRS_findFiducialMarks** (float32_t yn[], uint16_t fidMarkArray[])
Mark local peaks in the input signal y as potential candidates for QRS complexes (AKA "fiducial marks").
- static void **QRS_initLevels** (float32_t yn[])
Initialize the signal and noise levels for the QRS detector using the initial block of input signal data.
- static float32_t **QRS_updateLevel** (float32_t peakAmplitude, float32_t level)
Update signal or noise level based on a confirmed peak's amplitude.
- static float32_t **QRS_UpdateThreshold** (void)
Update the amplitude threshold used to identify peaks based on the signal and noise levels.
- void **QRS_Init** (void)
Initialize the QRS detector.
- void **QRS_Preprocess** (const float32_t xn[], float32_t yn[])
Preprocess the ECG data to remove noise and/or exaggerate the signal characteristic(s) of interest.
- float32_t **QRS_applyDecisionRules** (const float32_t yn[])
Calculate the average heart rate (HR) using predetermined decision rules.
- float32_t **QRS_runDetection** (const float32_t xn[], float32_t yn[])
Run the full algorithm (preprocessing and decision rules) on the inputted ECG data.

Variables

6.6.1 Detailed Description

Source code for QRS module.

Author

Bryan McElvy

6.7 QRS.h File Reference

QRS detection algorithm functions.

```
#include "arm_math_types.h"
#include "dsp/filtering_functions.h"
#include "dsp/statistics_functions.h"
#include <stdbool.h>
#include <stdint.h>
```

Macros

- `#define QRS_SAMP_FREQ 200`
- `#define QRS_NUM_SAMP (uint16_t)(1 << 10)`

Functions

- void **QRS_Init** (void)
Initialize the QRS detector.
- void **QRS_Preprocess** (const float32_t xn[], float32_t yn[])
Preprocess the ECG data to remove noise and/or exaggerate the signal characteristic(s) of interest.
- float32_t **QRS_applyDecisionRules** (const float32_t yn[])
Calculate the average heart rate (HR) using predetermined decision rules.
- float32_t **QRS_runDetection** (const float32_t xn[], float32_t yn[])
Run the full algorithm (preprocessing and decision rules) on the inputted ECG data.

6.7.1 Detailed Description

QRS detection algorithm functions.

Author

Bryan McElvy

This module contains functions for detecting heart rate ('HR') using a simplified version of the Pan-Tompkins algorithm.

6.8 FIFO.c File Reference

Source code for FIFO buffer module.

```
#include "FIFO.h"
#include "NewAssert.h"
#include <stdint.h>
#include <stdbool.h>
```

Data Structures

- struct [FIFO_t](#)

Functions

- [FIFO_t * FIFO_Init](#) (volatile uint32_t buffer[], const uint32_t N)
Initialize a FIFO buffer of length N.

Basic Operations

- void [FIFO_Put](#) (volatile [FIFO_t](#) *fifo, const uint32_t val)
Add a value to the end of the buffer.
- uint32_t [FIFO_Get](#) (volatile [FIFO_t](#) *fifo)
Remove the first value of the buffer.
- void [FIFO_TransferOne](#) (volatile [FIFO_t](#) *srcFifo, volatile [FIFO_t](#) *destFifo)
Transfer a value from one FIFO buffer to another.

Bulk Removal

- void [FIFO_Flush](#) (volatile [FIFO_t](#) *fifo, uint32_t outputBuffer[])
Empty the FIFO buffer's contents into an array.
- void [FIFO_Reset](#) (volatile [FIFO_t](#) *fifo)
Reset the FIFO buffer.
- void [FIFO_TransferAll](#) (volatile [FIFO_t](#) *srcFifo, volatile [FIFO_t](#) *destFifo)
Transfer the contents of one FIFO buffer to another.

Peeking

- uint32_t [FIFO_PeekOne](#) (volatile [FIFO_t](#) *fifo)
See the first element in the FIFO without removing it.
- void [FIFO_PeekAll](#) (volatile [FIFO_t](#) *fifo, uint32_t outputBuffer[])
See the FIFO buffer's contents without removing them.

Status Checks

- bool [FIFO_isFull](#) (volatile [FIFO_t](#) *fifo)
Check if the FIFO buffer is full.
- bool [FIFO_isEmpty](#) (volatile [FIFO_t](#) *fifo)
Check if the FIFO buffer is empty.
- uint32_t [FIFO_getCurrSize](#) (volatile [FIFO_t](#) *fifo)
Get the current size of the FIFO buffer.

Variables

- static `FIFO_t buffer_pool` [FIFO_POOL_SIZE] = { 0 }
pre-allocated buffer pool
- static `uint8_t free_buffers` = FIFO_POOL_SIZE
no. of remaining buffers

6.8.1 Detailed Description

Source code for FIFO buffer module.

Author

Bryan McElvy

6.9 FIFO.h File Reference

FIFO buffer data structure.

```
#include "NewAssert.h"
#include <stdbool.h>
#include <stdint.h>
```

Macros

- `#define FIFO_POOL_SIZE 5`

Functions

- `FIFO_t * FIFO_Init` (volatile `uint32_t` buffer[], const `uint32_t` N)
Initialize a FIFO buffer of length N.

Basic Operations

- void `FIFO_Put` (volatile `FIFO_t` *fifo, const `uint32_t` val)
Add a value to the end of the buffer.
- `uint32_t FIFO_Get` (volatile `FIFO_t` *fifo)
Remove the first value of the buffer.
- void `FIFO_TransferOne` (volatile `FIFO_t` *srcFifo, volatile `FIFO_t` *destFifo)
Transfer a value from one FIFO buffer to another.

Bulk Removal

- void `FIFO_Flush` (volatile `FIFO_t` *fifo, `uint32_t` outputBuffer[])
Empty the FIFO buffer's contents into an array.
- void `FIFO_Reset` (volatile `FIFO_t` *fifo)
Reset the FIFO buffer.
- void `FIFO_TransferAll` (volatile `FIFO_t` *srcFifo, volatile `FIFO_t` *destFifo)
Transfer the contents of one FIFO buffer to another.

Peeking

- uint32_t [FIFO_PeekOne](#) (volatile [FIFO_t](#) *fifo)
See the first element in the FIFO without removing it.
- void [FIFO_PeekAll](#) (volatile [FIFO_t](#) *fifo, uint32_t outputBuffer[])
See the FIFO buffer's contents without removing them.

Status Checks

- bool [FIFO_isFull](#) (volatile [FIFO_t](#) *fifo)
Check if the FIFO buffer is full.
- bool [FIFO_isEmpty](#) (volatile [FIFO_t](#) *fifo)
Check if the FIFO buffer is empty.
- uint32_t [FIFO_getCurrSize](#) (volatile [FIFO_t](#) *fifo)
Get the current size of the FIFO buffer.

6.9.1 Detailed Description

FIFO buffer data structure.

Author

Typedefs

- typedef volatile uint32_t * **register_t**

Functions

- static void **ISR_setStatus** (const uint8_t vectorNum, bool isEnabled)
- void **ISR_GlobalDisable** (void)
Disable all interrupts globally.
- void **ISR_GlobalEnable** (void)
Enable all interrupts globally.
- static **ISR_t** newVectorTable[VECTOR_TABLE_SIZE] **__attribute__** ((aligned(VECTOR_TABLE_SIZE, ALIGNMENT)))
- void **ISR_InitNewTableInRam** (void)
Relocate the vector table to RAM.
- void **ISR_addToIntTable** (ISR_t isr, const uint8_t vectorNum)
Add an ISR to the interrupt table.
- void **ISR_setPriority** (const uint8_t vectorNum, const uint8_t priority)
Set the priority for an interrupt.
- void **ISR_Enable** (const uint8_t vectorNum)
Enable an interrupt in the NVIC.
- void **ISR_Disable** (const uint8_t vectorNum)
Disable an interrupt in the NVIC.
- void **ISR_triggerInterrupt** (const uint8_t vectorNum)
Generate a software-generated interrupt (SGI).
- void **ISR_clearPending** (const uint8_t vectorNum)
Clear an ISR's pending bit.

Variables

- static bool **interruptsAreEnabled** = true
- void(*const **interruptVectorTable** [])(void)
- static bool **isTableCopiedToRam** = false

6.10.1 Detailed Description

```
void ISR_InitNewTableInRam (
    void )
```

Relocate the vector table to RAM.

Precondition

Call this after disabling interrupts globally.

Postcondition

The vector table is now located in RAM, allowing the ISRs listed in the startup file to be replaced.

See also

[ISR_GlobalDisable\(\)](#), [ISR_addToIntTable\(\)](#)

ISR_addToIntTable()

```
void ISR_addToIntTable (
    ISR_t isr,
    const uint8_t vectorNum )
```

Add an ISR to the interrupt table.

Precondition

Initialize a new vector table in RAM before calling this function.

Parameters

| | | |
|----|------------------|--|
| in | <i>isr</i> | Name of the ISR to add. |
| in | <i>vectorNum</i> | ISR's vector number (i.e. offset from the top of the table). Should be in range [16, 154]. |

Postcondition

The ISR is now added to the vector table and available to be called.

See also

`ISR_relocateIntTableToRam()`

ISR_setPriority()

```
void ISR_setPriority (
    const uint8_t vectorNum,
    const uint8_t priority )
```

Set the priority for an interrupt.

Parameters

| | | |
|----|------------------|--|
| in | <i>vectorNum</i> | ISR's vector number (i.e. offset from the top of the table). Should be in range [16, 154]. |
| in | <i>priority</i> | Priority to assign. Highest priority is 0, lowest is 7. |

ISR_Enable()

```
void ISR_Enable (
    const uint8_t vectorNum )
```

Enable an interrupt in the NVIC.

Precondition

If needed, set the interrupt's priority (default 0, or highest priority) before calling this.

Parameters

| | | |
|----|------------------|--|
| in | <i>vectorNum</i> | ISR's vector number (i.e. offset from the top of the table). Should be in range [16, 154]. |
|----|------------------|--|

See also

[ISR_setPriority\(\)](#), [ISR_Disable\(\)](#)

ISR_Disable()

```
void ISR_Disable (
    const uint8_t vectorNum )
```

Disable an interrupt in the NVIC.

Parameters

| | | |
|----|------------------|--|
| in | <i>vectorNum</i> | ISR's vector number (i.e. offset from the top of the table). Should be in range [16, 154]. |
|----|------------------|--|

See also[ISR_Enable\(\)](#)**ISR_triggerInterrupt()**

```
void ISR_triggerInterrupt (
    const uint8_t vectorNum )
```

Generate a software-generated interrupt (SGI).

Precondition

Enable the ISR (and set priority as needed) for calling this.

Enable all interrupts before calling this.

Parameters

| | | |
|----|------------------|--|
| in | <i>vectorNum</i> | ISR's vector number (i.e. offset from the top of the table). Should be in range [16, 154]. |
|----|------------------|--|

Postcondition

The ISR should trigger once any higher priority ISRs return.

See also[ISR_clearPending\(\)](#)**ISR_clearPending()**

```
void ISR_clearPending (
    const uint8_t vectorNum )
```

Clear an ISR's pending bit.

Precondition

This should be called during the ISR for an SGI.

Parameters

| | | |
|----|------------------|--|
| in | <i>vectorNum</i> | ISR's vector number (i.e. offset from the top of the table). Should be in range [16, 154]. |
|----|------------------|--|

Postcondition

The ISR should not trigger again until re-activated.

6.11.1 Detailed Description

Module for configuring interrupt service routines (ISRs).

Author

Bryan McElvy

6.11.2 Function Documentation

ISR_GlobalDisable()

```
void ISR_GlobalDisable (
    void )
```

Disable all interrupts globally.

See also

[ISR_GlobalEnable\(\)](#)

ISR_GlobalEnable()

```
void ISR_GlobalEnable (
    void )
```

Enable all interrupts globally.

See also

[ISR_GlobalDisable\(\)](#)

ISR_InitNewTableInRam()

```
void ISR_InitNewTableInRam (
    void )
```

Relocate the vector table to RAM.

Precondition

Call this after disabling interrupts globally.

Postcondition

The vector table is now located in RAM, allowing the ISRs listed in the startup file to be replaced.

See also

[ISR_GlobalDisable\(\)](#), [ISR_addToIntTable\(\)](#)

ISR_addToIntTable()

```
void ISR_addToIntTable (
    ISR\_t isr,
    const uint8_t vectorNum )
```

Add an ISR to the interrupt table.

Precondition

Initialize a new vector table in RAM before calling this function.

Parameters

| | | |
|----|------------------|--|
| in | <i>isr</i> | Name of the ISR to add. |
| in | <i>vectorNum</i> | ISR's vector number (i.e. offset from the top of the table). Should be in range [16, 154]. |

Postcondition

The ISR is now added to the vector table and available to be called.

See also

[ISR_relocateIntTableToRam\(\)](#)

ISR_setPriority()

```
void ISR_setPriority (
    const uint8_t vectorNum,
    const uint8_t priority )
```

Set the priority for an interrupt.

Parameters

| | | |
|----|------------------|--|
| in | <i>vectorNum</i> | ISR's vector number (i.e. offset from the top of the table). Should be in range [16, 154]. |
| in | <i>priority</i> | Priority to assign. Highest priority is 0, lowest is 7. |

ISR_Enable()

```
void ISR_Enable (
    const uint8_t vectorNum )
```

Enable an interrupt in the NVIC.

Precondition

If needed, set the interrupt's priority (default 0, or highest priority) before calling this.

Parameters

| | | |
|----|------------------|--|
| in | <i>vectorNum</i> | ISR's vector number (i.e. offset from the top of the table). Should be in range [16, 154]. |
|----|------------------|--|

See also

[ISR_setPriority\(\)](#), [ISR_Disable\(\)](#)

ISR_Disable()

```
void ISR_Disable (
    const uint8_t vectorNum )
```

Disable an interrupt in the NVIC.

Parameters

| | | |
|----|------------------|--|
| in | <i>vectorNum</i> | ISR's vector number (i.e. offset from the top of the table). Should be in range [16, 154]. |
|----|------------------|--|

See also

[ISR_Enable\(\)](#)

ISR_triggerInterrupt()

```
void ISR_triggerInterrupt (
    const uint8_t vectorNum )
```

Generate a software-generated interrupt (SGI).

Precondition

Enable the ISR (and set priority as needed) for calling this.

Enable all interrupts before calling this.

Parameters

| | | |
|----|------------------|--|
| in | <i>vectorNum</i> | ISR's vector number (i.e. offset from the top of the table). Should be in range [16, 154]. |
|----|------------------|--|

Postcondition

The ISR should trigger once any higher priority ISRs return.

See also

[ISR_clearPending\(\)](#)

ISR_clearPending()

```
void ISR_clearPending (
    const uint8_t vectorNum )
```

Clear an ISR's pending bit.

Precondition

This should be called during the ISR for an SGI.

Parameters

| | | |
|-----------------|------------------------|--|
| <code>in</code> | <code>vectorNum</code> | ISR's vector number (i.e. offset from the top of the table). Should be in range [16, 154]. |
|-----------------|------------------------|--|

Postcondition

The ISR should not trigger again until re-activated.

6.12 lookup.c File Reference

Source code for DAQ module's lookup table.

```
#include "lookup.h"
#include "arm_math_types.h"
```

Functions

- `const float32_t * Lookup_GetPtr (void)`
Return a pointer to the DAQ lookup table.

Variables

- `static const float32_t LOOKUP_DQA_TABLE [4096]`
Lookup table for converting ADC data from unsigned 12-bit integer values to 32-bit floating point values.

6.12.1 Detailed Description

Source code for DAQ module's lookup table.

Author

Bryan McElvy

6.13 lookup.h File Reference

Lookup table for DAQ module.

```
#include "arm_math_types.h"
```

Macros

- `#define LOOKUP_DAQ_MAX (float32_t) 5.5`
- `#define LOOKUP_DAQ_MIN (float32_t)(-5.5)`

Functions

- `const float32_t * Lookup_GetPtr (void)`
Return a pointer to the DAQ lookup table.

6.13.1 Detailed Description

Lookup table for DAQ module.

Author

6.14 NewAssert.c File Reference

Source code for custom `assert` implementation.

```
#include "NewAssert.h"  
#include <stdbool.h>
```

Functions

- `void Assert (bool condition)`
Custom `assert` implementation that is more lightweight than the one from `newlib`.

6.14.1 Detailed Description

Source code for custom `assert` implementation.

Author

Bryan McElvy

6.15 NewAssert.h File Reference

Header file for custom `assert` implementation.

```
#include <stdbool.h>
```

Functions

- void **Assert** (bool condition)
Custom assert implementation that is more lightweight than the one from newlib.

6.15.1 Detailed Description

Header file for custom `assert` implementation.

Author

Bryan McElvy

6.16 ADC.c File Reference

Source code for ADC module.

```
#include "ADC.h"
#include "GPIO.h"
#include "arm_math_types.h"
#include "tm4c123gh6pm.h"
#include <stdint.h>
```

Functions

- void **ADC_Init** (void)
Initialize ADC0 as a single-input analog-to-digital converter.
- void **ADC_InterruptEnable** (void)
Enable the ADC interrupt.
- void **ADC_InterruptDisable** (void)
Disable the ADC interrupt.
- void **ADC_InterruptAcknowledge** (void)
Acknowledge the ADC interrupt, clearing the flag.

6.16.1 Detailed Description

Source code for ADC module.

Author

Bryan McElvy

6.17 ADC.h File Reference

Driver module for analog-to-digital conversion (ADC).

```
#include "GPIO.h"
#include "arm_math_types.h"
#include "tm4c123gh6pm.h"
#include <stdint.h>
```

Functions

- void **ADC_Init** (void)
Initialize ADC0 as a single-input analog-to-digital converter.
- void **ADC_InterruptEnable** (void)
Enable the ADC interrupt.
- void **ADC_InterruptDisable** (void)
Disable the ADC interrupt.
- void **ADC_InterruptAcknowledge** (void)
Acknowledge the ADC interrupt, clearing the flag.

6.17.1 Detailed Description

Driver module for analog-to-digital conversion (ADC).

Author

Bryan McElvy

6.18 GPIO.c File Reference

Source code for GPIO module.

Functions

- **GPIO_Port_t * GPIO_InitPort** (GPIO_PortName_t portName)
Initialize a GPIO Port and return a pointer to its struct.
- bool **GPIO_isPortInit** (GPIO_Port_t *gpioPort)
Check if the GPIO port is initialized.
- uint32_t **GPIO_getBaseAddr** (GPIO_Port_t *gpioPort)
- void **GPIO_ConfigDirOutput** (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask)
Configure the direction of the specified GPIO pins. All pins are configured to *INPUT* by default, so this function should only be called to specify *OUTPUT* pins.
- void **GPIO_ConfigDirInput** (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask)
Configure the specified GPIO pins as *INPUT* pins. All pins are configured to *INPUT* by default, so this function is technically unnecessary, but useful for code readability.
- void **GPIO_ConfigPullUp** (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask)
Activate the specified pins' internal pull-up resistors.
- void **GPIO_ConfigPullDown** (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask)
Activate the specified pins' internal pull-down resistors.
- void **GPIO_ConfigDriveStrength** (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask, uint8_t drive_mA)
Configure the specified pins' drive strength. Pins are initialized with 2[mA] drive strength, so this is only needed for a drive strength of 4[mA] or 8[mA].
- void **GPIO_EnableDigital** (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask)
Enable digital I/O for the specified pins.
- void **GPIO_DisableDigital** (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask)
Disable digital I/O for the specified pins.
- void **GPIO_ConfigInterrupts_Edge** (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask, bool risingEdge)
Configure the specified GPIO pins to trigger an interrupt on the rising or falling edge of an input.
- void **GPIO_ConfigInterrupts_BothEdges** (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask)
Configure the specified GPIO pins to trigger an interrupt on both edges of an input.
- void **GPIO_ConfigInterrupts_LevelTrig** (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask, bool highLevel)
Configure the specified GPIO pins to trigger an interrupt on a high level or low level pulse.
- void **GPIO_ConfigNVIC** (GPIO_Port_t *gpioPort, uint8_t priority)
Configure interrupts for the selected port in the NVIC.
- uint8_t **GPIO_ReadPins** (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask)
Read from the specified GPIO pin.

- void [GPIO_WriteHigh](#) ([GPIO_Port_t](#) *gpioPort, [GPIO_Pin_t](#) pinMask)
Write a 1 to the specified GPIO pins.
- void [GPIO_WriteLow](#) ([GPIO_Port_t](#) *gpioPort, [GPIO_Pin_t](#) pinMask)
Write a 0 to the specified GPIO pins.
- void [GPIO_Toggle](#) ([GPIO_Port_t](#) *gpioPort, [GPIO_Pin_t](#) pinMask)
Toggle the specified GPIO pins.
- void [GPIO_ConfigAltMode](#) ([GPIO_Port_t](#) *gpioPort, [GPIO_Pin_t](#) pinMask)
Activate the alternate mode for the specified pins.
- void [GPIO_ConfigPortCtrl](#) ([GPIO_Port_t](#) *gpioPort, [GPIO_Pin_t](#) pinMask, [uint8_t](#) fieldEncoding)
Specify the alternate mode to use for the specified pins.
- void [GPIO_ConfigAnalog](#) ([GPIO_Port_t](#) *gpioPort, [GPIO_Pin_t](#) pinMask)
Activate analog mode for the specified GPIO pins.

Variables

6.18.1 Detailed Description

Source code for GPIO module.

Author

Bryan McElvy

6.18.2 Function Documentation

GPIO_InitPort()

```
GPIO\_Port\_t * GPIO_InitPort (
    GPIO\_PortName\_t portName )
```

Initialize a GPIO Port and return a pointer to its struct.

Parameters

| | | |
|----|-----------------|--------------------------|
| in | <i>portName</i> | Name of the chosen port. |
|----|-----------------|--------------------------|

Returns

[GPIO_Port_t](#)* Pointer to the GPIO port's struct.

GPIO_isPortInit()

```
bool GPIO_isPortInit (
    GPIO\_Port\_t * gpioPort )
```

Check if the GPIO port is initialized.

Parameters

| | | |
|-----|-----------------|---|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| out | <i>true</i> | The GPIO port is initialized. |
| out | <i>false</i> | The GPIO port has not been initialized. |

GPIO_ConfigDirOutput()

```
void GPIO_ConfigDirOutput (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Configure the direction of the specified GPIO pins. All pins are configured to `INPUT` by default, so this function should only be called to specify `OUTPUT` pins.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>bitMask</i> | Bit mask corresponding to the intended <code>OUTPUT</code> pin(s). |

GPIO_ConfigDirInput()

```
void GPIO_ConfigDirInput (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Configure the specified GPIO pins as `INPUT` pins. All pins are configured to `INPUT` by default, so this function is technically unnecessary, but useful for code readability.

Parameters

| | | |
|----|-----------------|---|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>bitMask</i> | Bit mask corresponding to the intended <code>INPUT</code> pin(s). |

GPIO_ConfigPullUp()

```
void GPIO_ConfigPullUp (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Activate the specified pins' internal pull-up resistors.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |

GPIO_ConfigPullDown()

```
void GPIO_ConfigPullDown (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Activate the specified pins' internal pull-down resistors.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |

GPIO_ConfigDriveStrength()

```
void GPIO_ConfigDriveStrength (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask,
    uint8_t drive_mA )
```

Configure the specified pins' drive strength. Pins are initialized with 2[mA] drive strength, so this is only needed for a drive strength of 4[mA] or 8[mA].

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |
| in | <i>drive_mA</i> | Drive strength in [mA]. Should be 2, 4, or 8 [mA]. |

GPIO_EnableDigital()

```
void GPIO_EnableDigital (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Enable digital I/O for the specified pins.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |

GPIO_DisableDigital()

```
void GPIO_DisableDigital (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Disable digital I/O for the specified pins.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |

GPIO_ConfigInterrupts_Edge()

```
void GPIO_ConfigInterrupts_Edge (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask,
    bool risingEdge )
```

Configure the specified GPIO pins to trigger an interrupt on the rising or falling edge of an input.

Parameters

| | | |
|----|-------------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |
| in | <i>risingEdge</i> | true for rising edge, false for falling edge |

GPIO_ConfigInterrupts_BothEdges()

```
void GPIO_ConfigInterrupts_BothEdges (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Configure the specified GPIO pins to trigger an interrupt on both edges of an input.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |

GPIO_ConfigInterrupts_LevelTrig()

```
void GPIO_ConfigInterrupts_LevelTrig (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask,
    bool highLevel )
```

Configure the specified GPIO pins to trigger an interrupt on a high level or low level pulse.

Parameters

| | | |
|----|------------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |
| in | <i>highLevel</i> | true for high level, false for low level |

GPIO_ConfigNVIC()

```
void GPIO_ConfigNVIC (
    GPIO_Port_t * gpioPort,
    uint8_t priority )
```

Configure interrupts for the selected port in the NVIC.

Parameters

| | | |
|----|-----------------|---|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>priority</i> | Priority number between 0 (highest) and 7 (lowest). |

GPIO_ReadPins()

```
uint8_t GPIO_ReadPins (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Read from the specified GPIO pin.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |

GPIO_WriteHigh()

```
void GPIO_WriteHigh (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Write a 1 to the specified GPIO pins.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |

GPIO_WriteLow()

```
void GPIO_WriteLow (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Write a 0 to the specified GPIO pins.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |

GPIO_Toggle()

```
void GPIO_Toggle (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Toggle the specified GPIO pins.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |

GPIO_ConfigAltMode()

```
void GPIO_ConfigAltMode (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Activate the alternate mode for the specified pins.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |

GPIO_ConfigPortCtrl()

```
void GPIO_ConfigPortCtrl (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask,
    uint8_t fieldEncoding )
```

Specify the alternate mode to use for the specified pins.

Parameters

| | | |
|----|----------------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |
| in | <i>fieldEncoding</i> | Number corresponding to intended alternate mode. |

GPIO_ConfigAnalog()

```
void GPIO_ConfigAnalog (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Activate analog mode for the specified GPIO pins.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |

6.18.3 Variable Documentation

GPIO_PTR_ARR

```
GPIO_Port_t GPIO_PTR_ARR[6] [static]
```

Initial value:

```
= {
    { GPIO_PORTA_BASE_ADDRESS, (GPIO_PORTA_BASE_ADDRESS + GPIO_DATA_R_OFFSET), false },
    { GPIO_PORTB_BASE_ADDRESS, (GPIO_PORTB_BASE_ADDRESS + GPIO_DATA_R_OFFSET), false },

Functions

- [GPIO_Port_t * GPIO_InitPort](#) (GPIO_PortName_t portName)
Initialize a GPIO Port and return a pointer to its struct.
- [uint32_t GPIO_getBaseAddr](#) (GPIO_Port_t *gpioPort)
- [bool GPIO_isPortInit](#) (GPIO_Port_t *gpioPort)
Check if the GPIO port is initialized.
- [void GPIO_ConfigDirOutput](#) (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask)
Configure the direction of the specified GPIO pins. All pins are configured to INPUT by default, so this function should only be called to specify OUTPUT pins.
- [void GPIO_ConfigDirInput](#) (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask)
Configure the specified GPIO pins as INPUT pins. All pins are configured to INPUT by default, so this function is technically unnecessary, but useful for code readability.
- [void GPIO_ConfigPullUp](#) (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask)
Activate the specified pins' internal pull-up resistors.
- [void GPIO_ConfigPullDown](#) (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask)
Activate the specified pins' internal pull-down resistors.
- [void GPIO_ConfigDriveStrength](#) (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask, uint8_t drive_mA)
Configure the specified pins' drive strength. Pins are initialized with 2[mA] drive strength, so this is only needed for a drive strength of 4[mA] or 8[mA].
- [void GPIO_EnableDigital](#) (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask)
Enable digital I/O for the specified pins.
- [void GPIO_DisableDigital](#) (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask)
Disable digital I/O for the specified pins.
- [void GPIO_ConfigInterrupts_Edge](#) (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask, bool risingEdge)
Configure the specified GPIO pins to trigger an interrupt on the rising or falling edge of an input.
- [void GPIO_ConfigInterrupts_BothEdges](#) (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask)
Configure the specified GPIO pins to trigger an interrupt on both edges of an input.
- [void GPIO_ConfigInterrupts_LevelTrig](#) (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask, bool highLevel)
Configure the specified GPIO pins to trigger an interrupt on a high level or low level pulse.
- [void GPIO_ConfigNVIC](#) (GPIO_Port_t *gpioPort, uint8_t priority)
Configure interrupts for the selected port in the NVIC.
- [uint8_t GPIO_ReadPins](#) (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask)
Read from the specified GPIO pin.
- [void GPIO_WriteHigh](#) (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask)
Write a 1 to the specified GPIO pins.
- [void GPIO_WriteLow](#) (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask)
Write a 0 to the specified GPIO pins.
- [void GPIO_Toggle](#) (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask)
Toggle the specified GPIO pins.
- [void GPIO_ConfigAltMode](#) (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask)
Activate the alternate mode for the specified pins.
- [void GPIO_ConfigPortCtrl](#) (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask, uint8_t fieldEncoding)
Specify the alternate mode to use for the specified pins.
- [void GPIO_ConfigAnalog](#) (GPIO_Port_t *gpioPort, GPIO_Pin_t pinMask)
Activate analog mode for the specified GPIO pins.

6.19.1 Detailed Description

Header file for general-purpose input/output (GPIO) device driver.

Author

Bryan McElvy

6.19.2 Function Documentation

GPIO_InitPort()

```
GPIO_Port_t * GPIO_InitPort (
    GPIO_PortName_t portName )
```

Initialize a GPIO Port and return a pointer to its `struct`.

Parameters

| | | |
|----|-----------------|--------------------------|
| in | <i>portName</i> | Name of the chosen port. |
|----|-----------------|--------------------------|

Returns

GPIO_Port_t* Pointer to the GPIO port's `struct`.

GPIO_isPortInit()

```
bool GPIO_isPortInit (
    GPIO_Port_t * gpioPort )
```

Check if the GPIO port is initialized.

Parameters

| | | |
|-----|-----------------|---|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| out | <i>true</i> | The GPIO port is initialized. |
| out | <i>false</i> | The GPIO port has not been initialized. |

GPIO_ConfigDirOutput()

```
void GPIO_ConfigDirOutput (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Configure the direction of the specified GPIO pins. All pins are configured to `INPUT` by default, so this function should only be called to specify `OUTPUT` pins.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>bitMask</i> | Bit mask corresponding to the intended <code>OUTPUT</code> pin(s). |

GPIO_ConfigDirInput()

```
void GPIO_ConfigDirInput (
```

```
GPIO_Port_t * gpioPort,  
GPIO_Pin_t pinMask )
```

Configure the specified GPIO pins as INPUT pins. All pins are configured to INPUT by default, so this function is technically unnecessary, but useful for code readability.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>bitMask</i> | Bit mask corresponding to the intended INPUT pin(s). |

GPIO_ConfigPullUp()

```
void GPIO_ConfigPullUp (  
    GPIO_Port_t * gpioPort,  
    GPIO_Pin_t pinMask )
```

Activate the specified pins' internal pull-up resistors.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |

GPIO_ConfigPullDown()

```
void GPIO_ConfigPullDown (  
    GPIO_Port_t * gpioPort,  
    GPIO_Pin_t pinMask )
```

Activate the specified pins' internal pull-down resistors.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |

GPIO_ConfigDriveStrength()

```
void GPIO_ConfigDriveStrength (  
    GPIO_Port_t * gpioPort,  
    GPIO_Pin_t pinMask,  
    uint8_t drive_mA )
```

Configure the specified pins' drive strength. Pins are initialized with 2[mA] drive strength, so this is only needed for a drive strength of 4[mA] or 8[mA].

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |
| in | <i>drive_mA</i> | Drive strength in [mA]. Should be 2, 4, or 8 [mA]. |

GPIO_EnableDigital()

```
void GPIO_EnableDigital (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Enable digital I/O for the specified pins.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |

GPIO_DisableDigital()

```
void GPIO_DisableDigital (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Disable digital I/O for the specified pins.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |

GPIO_ConfigInterrupts_Edge()

```
void GPIO_ConfigInterrupts_Edge (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask,
    bool risingEdge )
```

Configure the specified GPIO pins to trigger an interrupt on the rising or falling edge of an input.

Parameters

| | | |
|----|-------------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |
| in | <i>risingEdge</i> | true for rising edge, false for falling edge |

GPIO_ConfigInterrupts_BothEdges()

```
void GPIO_ConfigInterrupts_BothEdges (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Configure the specified GPIO pins to trigger an interrupt on both edges of an input.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |

GPIO_ConfigInterrupts_LevelTrig()

```
void GPIO_ConfigInterrupts_LevelTrig (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask,
    bool highLevel )
```

Configure the specified GPIO pins to trigger an interrupt on a high level or low level pulse.

Parameters

| | | |
|----|------------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |
| in | <i>highLevel</i> | true for high level, false for low level |

GPIO_ConfigNVIC()

```
void GPIO_ConfigNVIC (
    GPIO_Port_t * gpioPort,
    uint8_t priority )
```

Configure interrupts for the selected port in the NVIC.

Parameters

| | | |
|----|-----------------|---|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>priority</i> | Priority number between 0 (highest) and 7 (lowest). |

GPIO_ReadPins()

```
uint8_t GPIO_ReadPins (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Read from the specified GPIO pin.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |

GPIO_WriteHigh()

```
void GPIO_WriteHigh (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Write a 1 to the specified GPIO pins.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |

GPIO_WriteLow()

```
void GPIO_WriteLow (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Write a 0 to the specified GPIO pins.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |

GPIO_Toggle()

```
void GPIO_Toggle (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Toggle the specified GPIO pins.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |

GPIO_ConfigAltMode()

```
void GPIO_ConfigAltMode (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Activate the alternate mode for the specified pins.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |

GPIO_ConfigPortCtrl()

```
void GPIO_ConfigPortCtrl (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask,
    uint8_t fieldEncoding )
```

Specify the alternate mode to use for the specified pins.

Parameters

| | | |
|----|----------------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |
| in | <i>fieldEncoding</i> | Number corresponding to intended alternate mode. |

GPIO_ConfigAnalog()

```
void GPIO_ConfigAnalog (
    GPIO_Port_t * gpioPort,
    GPIO_Pin_t pinMask )
```

Activate analog mode for the specified GPIO pins.

Parameters

| | | |
|----|-----------------|--|
| in | <i>gpioPort</i> | Pointer to the specified GPIO port. |
| in | <i>pinMask</i> | Bit mask corresponding to the intended pin(s). |

6.20 PLL.c File Reference

Implementation details for phase-lock-loop (PLL) functions.

```
#include "PLL.h"
#include "tm4c123gh6pm.h"
#include <stdint.h>
```

Functions

- void **PLL_Init** (void)
Initializes the phase-locked-loop (PLL), allowing a bus frequency of 80[MHz].

6.20.1 Detailed Description

Implementation details for phase-lock-loop (PLL) functions.

Author

Bryan McElvy

6.21 PLL.h File Reference

Driver module for activating the phase-locked-loop (PLL).

```
#include "tm4c123gh6pm.h"  
#include <stdint.h>
```

Functions

- void **PLL_Init** (void)
Initializes the phase-locked-loop (PLL), allowing a bus frequency of 80[MHz].

6.21.1 Detailed Description

Driver module for activating the phase-locked-loop (PLL).

Author

Bryan McElvy

6.22 SPI.c File Reference

Source code for SPI module.

```
#include "SPI.h"  
#include "GPIO.h"  
#include "tm4c123gh6pm.h"  
#include <stdbool.h>  
#include <stdint.h>
```

Macros

- #define **SPI_SET_DC**() (GPIO_PORTA_DATA_R |= 0x40)
- #define **SPI_CLEAR_DC**() (GPIO_PORTA_DATA_R &= ~(0x40))
- #define **SPI_IS_BUSY** (SSI0_SR_R & 0x10)
- #define **SPI_TX_ISNOTFULL** (SSI0_SR_R & 0x02)

Enumerations

- enum {
SPI_CLK_PIN = GPIO_PIN2 , **SPI_CS_PIN** = GPIO_PIN3 , **SPI_RX_PIN** = GPIO_PIN4 , **SPI_TX_PIN** = GPIO_PIN5 ,
SPI_DC_PIN = GPIO_PIN6 , **SPI_RESET_PIN** = GPIO_PIN7 , **SPI_SSI0_PINS** = (SPI_CLK_PIN | SPI_CS_PIN | SPI_RX_PIN | SPI_TX_PIN) , **SPI_GPIO_PINS** = (SPI_DC_PIN | SPI_RESET_PIN) ,
SPI_ALL_PINS = (SPI_SSI0_PINS | SPI_GPIO_PINS) }

Functions

- void **SPI_Init** (void)
Initialize SSI0 to act as an SPI Controller (AKA Master) in mode 0.
- uint8_t **SPI_Read** (void)
Read data from the peripheral.
- void **SPI_WriteCmd** (uint8_t cmd)
Write an 8-bit command to the peripheral.
- void **SPI_WriteData** (uint8_t data)
Write 8-bit data to the peripheral.

6.22.1 Detailed Description

Source code for SPI module.

Author

Bryan McElvy

6.23 SPI.h File Reference

Driver module for using the serial peripheral interface (SPI) protocol.

```
#include "GPIO.h"
#include "FIFO.h"
#include "tm4c123gh6pm.h"
#include <stdbool.h>
#include <stdint.h>
```

Functions

- void [SPI_Init](#) (void)
Initialize SSI0 to act as an SPI Controller (AKA Master) in mode 0.
- uint8_t [SPI_Read](#) (void)
Read data from the peripheral.
- void [SPI_WriteCmd](#) (uint8_t cmd)
Write an 8-bit command to the peripheral.
- void [SPI_WriteData](#) (uint8_t data)
Write 8-bit data to the peripheral.

6.23.1 Detailed Description

Driver module for using the serial peripheral interface (SPI) protocol.

Author

Bryan McElvy

6.24 SysTick.c File Reference

Implementation details for SysTick functions.

```
#include "SysTick.h"  
#include "tm4c123gh6pm.h"  
#include <stdint.h>
```

Functions

- void **SysTick_Timer_Init** (void)
Initialize SysTick for timing purposes.
- void **SysTick_Wait1ms** (uint32_t delay_ms)
Delay for specified amount of time in [ms]. Assumes f_bus = 80[MHz].
- void [SysTick_Interrupt_Init](#) (uint32_t time_ms)
Initialize SysTick for interrupts.

6.24.1 Detailed Description

Implementation details for SysTick functions.

Author

Bryan McElvy

6.25 SysTick.h File Reference

Driver module for using SysTick-based timing and/or interrupts.

```
#include "tm4c123gh6pm.h"
#include <stdint.h>
```

Functions

- void **SysTick_Timer_Init** (void)
Initialize SysTick for timing purposes.
- void **SysTick_Wait1ms** (uint32_t delay_ms)
Delay for specified amount of time in [ms]. Assumes f_bus = 80[MHz].
- void **SysTick_Interrupt_Init** (uint32_t time_ms)
Initialize SysTick for interrupts.

Author

Bryan McElvy

UART0 uses PA0 and PA1, which are not broken out but can connect to a PC's serial port via USB.

UART1 uses PB0 (Rx) and PB1 (Tx), which are broken out but do not connect to a serial port.

6.30 main.c File Reference

Main program file for ECG-HRM.

```
#include "DAQ.h"
#include "Debug.h"
#include "LCD.h"
#include "QRS.h"
#include "PLL.h"
```

Functions

- int **main** (void)
- void **ADC0_SS3_Handler** (void)
Interrupt service routine (ISR) for collecting ADC samples.
- void **Timer1A_Handler** (void)
Interrupt service routine (ISR) for outputting data to the LCD.

6.30.1 Detailed Description

Main program file for ECG-HRM.

Author

Bryan McElvy

6.31 ILI9341.c File Reference

Source code for ILI9341 module.

```
#include "ILI9341.h"
#include "SPI.h"
#include "Timer.h"
#include "FIFO.h"
#include "tm4c123gh6pm.h"
#include <stdbool.h>
#include <stdint.h>
```

Enumerations

- enum **Cmd_t** {
 NOP = 0x00 , **SWRESET** = 0x01 , **SPLIN** = 0x10 , **SPLOUT** = 0x11 ,
 PTLON = 0x12 , **NORON** = 0x13 , **DINVOFF** = 0x20 , **DINVON** = 0x21 ,
 CASET = 0x2A , **PASET** = 0x2B , **RAMWR** = 0x2C , **DISPOFF** = 0x28 ,
 DISPON = 0x29 , **PLTAR** = 0x30 , **VSCRDEF** = 0x33 , **MADCTL** = 0x36 ,
 VSCRADD = 0x37 , **IDMOFF** = 0x38 , **IDMON** = 0x39 , **PIXSET** = 0x3A ,
 FRMCTR1 = 0xB1 , **FRMCTR2** = 0xB2 , **FRMCTR3** = 0xB3 , **PRCTR** = 0xB5 ,
 IFCTL = 0xF6 }

Functions

- static void **ILI9341_setAddress** (uint16_t start_address, uint16_t end_address, bool is_row)
- static void **ILI9341_sendParams** (Cmd_t cmd)
Send a command and/or the data within the FIFO buffer. A command is only sent when cmd != NOP (where NOP = 0). Data is only sent if the FIFO buffer is not empty.
- void **ILI9341_Init** (Timer_t timer)
Initialize the LCD driver, the SPI module, and Timer2A.
- void **ILI9341_resetHard** (Timer_t timer)
Perform a hardware reset of the LCD driver.
- void **ILI9341_resetSoft** (Timer_t timer)

- Perform a software reset of the LCD driver.*

 - void [ILI9341_setSleepMode](#) (bool isSleeping, Timer_t timer)

Enter or exit sleep mode. The LCD driver is in sleep mode by default upon powering on or either kind of reset.
- void [ILI9341_setDispMode](#) (bool isNormal, bool isFullColors)

Set the display area and color expression.
- void [ILI9341_setPartialArea](#) (uint16_t rowStart, uint16_t rowEnd)

Set the partial display area for partial mode. Call before activating partial mode via [ILI9341_setDisplayMode\(\)](#).
- void [ILI9341_setDispInversion](#) (bool is_ON)

Toggle display inversion. Turning ON causes colors to be inverted on the display.
- void [ILI9341_setDispOutput](#) (bool is_ON)

Turn display output ON or OFF. This function clears the display and stops outputting to the display area, but does not affect frame memory or power.
- void [ILI9341_setScrollArea](#) (uint16_t topFixedArea, uint16_t vertScrollArea, uint16_t bottFixedArea)

Set the vertical scrolling area of the display. The sum of the three parameters should be equal to the max number of rows `NUM_ROWS = 320`.
- void [ILI9341_setScrollStart](#) (uint16_t startRow)

Set the start row for vertical scrolling.
- void [ILI9341_setMemAccessCtrl](#) (bool areRowsFlipped, bool areColsFlipped, bool areRowsAndCols↔Switched, bool isVertRefreshFlipped, bool isColorOrderFlipped, bool isHorRefreshFlipped)

Set how data is converted from memory to display.
- void [ILI9341_setColorDepth](#) (bool is_16bit)

Set the pixel format to be 16-bit (65K colors) or 18-bit (262K colors).
- void [ILI9341_NoOpCmd](#) (void)

Send the "No Operation" command (`NOP = 0x00`) to the LCD driver. Can be used to terminate the "Memory Write" (`RAMWR`) and "Memory Read" (`RAMRD`) commands, but does nothing otherwise.
- void [ILI9341_setFrameRateNorm](#) (uint8_t divisionRatio, uint8_t clocksPerLine)

TODO: Write brief.
- void [ILI9341_setFrameRateIdle](#) (uint8_t divisionRatio, uint8_t clocksPerLine)

TODO: Write brief.
- void [ILI9341_setInterface](#) (void)

Sets the interface for the ILI9341. The parameters for this command are hard-coded, so it only needs to be called once upon initialization.
- void [ILI9341_setRowAddress](#) (uint16_t startRow, uint16_t endRow)

not using backlight, so these aren't necessary
- void [ILI9341_setColAddress](#) (uint16_t startCol, uint16_t endCol)

Sets the start/end rows to be written to.
- void [ILI9341_writeMemCmd](#) (void)

Sends the "Write Memory" (`RAMWR`) command to the LCD driver, signalling that incoming data should be written to memory.
- void [ILI9341_writePixel](#) (uint8_t red, uint8_t green, uint8_t blue, bool is_16bit)

Write a single pixel to frame memory.

Variables

- static uint32_t [ILI9341_Buffer](#) [8]
- static [FIFO_t](#) * [ILI9341_Fifo](#)

6.31.1 Detailed Description

Source code for ILI9341 module.

Author

Bryan McElvy

6.32 ILI9341.h File Reference

Driver module for interfacing with an ILI9341 LCD driver.

```
#include "SPI.h"
#include "Timer.h"
#include "FIFO.h"
#include "tm4c123gh6pm.h"
#include <stdbool.h>
#include <stdint.h>
```

Macros

- `#define NUM_COLS (uint16_t) 240`
- `#define NUM_ROWS (uint16_t) 320`

Functions

- void **ILI9341_Init** (Timer_t timer)
Initialize the LCD driver, the SPI module, and Timer2A.
- void **ILI9341_resetHard** (Timer_t timer)
Perform a hardware reset of the LCD driver.
- void **ILI9341_resetSoft** (Timer_t timer)
Perform a software reset of the LCD driver.
- void **ILI9341_setSleepMode** (bool isSleeping, Timer_t timer)
Enter or exit sleep mode. The LCD driver is in sleep mode by default upon powering on or either kind of reset.
- void **ILI9341_setDispMode** (bool isNormal, bool isFullColors)
Set the display area and color expression.
- void **ILI9341_setPartialArea** (uint16_t rowStart, uint16_t rowEnd)
Set the partial display area for partial mode. Call before activating partial mode via ILI9341_setDisplayMode().
- void **ILI9341_setDispInversion** (bool is_ON)
Toggle display inversion. Turning ON causes colors to be inverted on the display.
- void **ILI9341_setDispOutput** (bool is_ON)
Turn display output ON or OFF. This function clears the display and stops outputting to the display area, but does not affect frame memory or power.
- void **ILI9341_setScrollArea** (uint16_t topFixedArea, uint16_t vertScrollArea, uint16_t bottFixedArea)
Set the vertical scrolling area of the display. The sum of the three parameters should be equal to the max number of rows NUM_ROWS = 320.
- void **ILI9341_setScrollStart** (uint16_t startRow)
Set the start row for vertical scrolling.
- void **ILI9341_setMemAccessCtrl** (bool areRowsFlipped, bool areColsFlipped, bool areRowsAndCols↵ Switched, bool isVertRefreshFlipped, bool isColorOrderFlipped, bool isHorRefreshFlipped)
Set how data is converted from memory to display.
- void **ILI9341_setColorDepth** (bool is_16bit)
Set the pixel format to be 16-bit (65K colors) or 18-bit (262K colors).
- void **ILI9341_NoOpCmd** (void)
Send the "No Operation" command (NOP = 0x00) to the LCD driver. Can be used to terminate the "Memory Write" (RAMWR) and "Memory Read" (RAMRD) commands, but does nothing otherwise.
- void **ILI9341_setFrameRateNorm** (uint8_t divisionRatio, uint8_t clocksPerLine)
TODO: Write brief.

- void [ILI9341_setFrameRateIdle](#) (uint8_t divisionRatio, uint8_t clocksPerLine)
TODO: Write brief.
- void [ILI9341_setBlankingPorch](#) (uint8_t vpf, uint8_t vbp, uint8_t hfp, uint8_t hbp)
TODO: Write.
- void [ILI9341_setInterface](#) (void)
Sets the interface for the ILI9341. The parameters for this command are hard-coded, so it only needs to be called once upon initialization.
- void [ILI9341_setRowAddress](#) (uint16_t startRow, uint16_t endRow)
not using backlight, so these aren't necessary
- void [ILI9341_setColAddress](#) (uint16_t startCol, uint16_t endCol)
Sets the start/end rows to be written to.
- void [ILI9341_writeMemCmd](#) (void)
Sends the "Write Memory" (RAMWR) command to the LCD driver, signalling that incoming data should be written to memory.
- void [ILI9341_writePixel](#) (uint8_t red, uint8_t green, uint8_t blue, bool is_16bit)
Write a single pixel to frame memory.

6.32.1 Detailed Description

Driver module for interfacing with an ILI9341 LCD driver.

Author

Bryan McElvy

This module contains functions for initializing and outputting graphical data to a 240RGBx320 resolution, 262K color-depth liquid crystal display (LCD). The module interfaces the LaunchPad (or any other board featuring the TM4C123GH6PM microcontroller) with an ILI9341 LCD driver chip via the SPI (serial peripheral interface) protocol.

6.33 Led.c File Reference

Source code for LED module.

```
#include "Led.h"
#include "GPIO.h"
#include "NewAssert.h"
#include <stdbool.h>
#include <stdint.h>
```

Data Structures

- struct [Led_t](#)

Functions

- `Led_t * Led_Init (GPIO_Port_t *gpioPort, GPIO_Pin_t pin)`
Initialize a light-emitting diode (LED) as an `Led_t`.
- `GPIO_Port_t * Led_GetPort (Led_t *led)`
Get the GPIO port associated with the LED.
- `GPIO_Pin_t Led_GetPin (Led_t *led)`
Get the GPIO pin associated with the LED.
- `bool Led_isOn (Led_t *led)`
Check the LED's status.
- `void Led_TurnOn (Led_t *led)`
Turn the LED ON.
- `void Led_TurnOff (Led_t *led)`
Turn the LED OFF.
- `void Led_Toggle (Led_t *led)`
Toggle the LED (i.e. OFF -> ON or ON -> OFF).

Variables

- `static Led_t Led_ObjPool [LED_POOL_SIZE] = { 0 }`
- `static uint8_t num_free_leds = LED_POOL_SIZE`

6.33.1 Detailed Description

Source code for LED module.

Author

Bryan McElvy

6.34 Led.h File Reference

Interface for LED module.

```
#include "GPIO.h"
#include "NewAssert.h"
#include <stdbool.h>
#include <stdint.h>
```

Macros

- `#define LED_POOL_SIZE 3`

Functions

- `Led_t * Led_Init (GPIO_Port_t *gpioPort, GPIO_Pin_t pin)`
Initialize a light-emitting diode (LED) as an `Led_t`.
- `GPIO_Port_t * Led_GetPort (Led_t *led)`
Get the GPIO port associated with the LED.
- `GPIO_Pin_t Led_GetPin (Led_t *led)`
Get the GPIO pin associated with the LED.
- `bool Led_isOn (Led_t *led)`
Check the LED's status.
- `void Led_TurnOn (Led_t *led)`
Turn the LED ON.
- `void Led_TurnOff (Led_t *led)`
Turn the LED OFF.
- `void Led_Toggle (Led_t *led)`
Toggle the LED (i.e. OFF -> ON or ON -> OFF).

6.34.1 Detailed Description

Interface for LED module.

Author

Bryan McElvy

6.35 test_adc.c File Reference

Test script for analog-to-digital conversion (ADC) module.

```
#include "ADC.h"
#include "PLL.h"
#include "GPIO.h"
#include "Timer.h"
#include "FIFO.h"
#include "tm4c123gh6pm.h"
#include <stdint.h>
```

Macros

- `#define LED_PINS (GPIO_Pin_t)(GPIO_PIN1 | GPIO_PIN2 | GPIO_PIN3)`
- `#define SAMPLING_PERIOD_MS (uint32_t) 5`
- `#define NUM_SAMPLES (uint32_t) 1000`

Functions

- `int main (void)`
- `void ADC0_SS3_Handler (void)`

Variables

- volatile bool **buffer_is_full** = false
- volatile `FIFO_t` * **fifo_ptr** = 0
- volatile uint32_t **fifo_buffer** [NUM_SAMPLES]

6.35.1 Detailed Description

Test script for analog-to-digital conversion (ADC) module.

Author

Bryan McElvy

6.36 test_daq.c File Reference

Test script for the data acquisition (DAQ) module.

```
#include "DAQ.h"
#include "Debug.h"
#include "LCD.h"
#include "ADC.h"
#include "PLL.h"
#include "FIFO.h"
#include "ISR.h"
#include "lookup.h"
#include "arm_math_types.h"
#include <stdbool.h>
#include <stdint.h>
```

Macros

- #define **DAQ_BUFFER_SIZE** 128
- #define **LCD_TOP_LINE** (Y_MAX - 48)
- #define **LCD_NUM_Y_VALS** 128
- #define **LCD_X_AXIS_OFFSET** 32
- #define **LCD_Y_MIN** (0 + LCD_X_AXIS_OFFSET)
- #define **LCD_Y_MAX** (LCD_NUM_Y_VALS + LCD_X_AXIS_OFFSET)

Functions

- void **LCD_plotNewSample** (uint16_t x, volatile const float32_t sample)
- int **main** (void)
- void **ADC0_SS3_Handler** (void)

Variables

- volatile `FIFO_t` * **inputFifo** = 0
